Wherever the art of medicine is loved, there is also a love of humanity.

– Hippocrates
Dedicated to all
past and present contributors
and
supporters of Toronto Notes
who have made the production of the 2017 edition possible!

The Toronto Notes is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto’s Faculty of Medicine. Programs that have received Toronto Notes funding include:

**Community Affairs Projects**
- Saturday Program for Inner City High School and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
- Let’s Talk Science
- Growing Up Healthy

**Annual Faculty Showcase Events**
- Bruce Tovee Lecture Series
- Daffydid, in support of the Canadian Cancer Society
- Earthones Benefit Concert
- Convocation and Ceremonies

**Medical School Clubs**
- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

**Scholarships and Bursaries**
- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

**Note:**
Many of you have wondered about the Toronto Notes logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius’ healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O’Brien, MD
Class of 2009
M.D. Program, University of Toronto
Dear Readers,

As the Editors-in-Chief of Toronto Notes 2017, we are proud to present this updated edition.

Toronto Notes began humbly in 1985 from a set of student notes circulated among medical students at the University of Toronto. Over time, Toronto Notes has grown into one of the premier study resources for generations of Canadian medical trainees. This rich history solidified our commitment to publish a comprehensive study resource for medical students engaged in clinical rotations and studying for both the Canadian MCCQE Part 1 and USMLE Step 2.

For the past 32 years we have remained committed to our original vision. The 2017 edition of Toronto Notes contains significant improvements including:

1. A new emphasis on ‘Approaches to Common Clinical Presentations’ in addition to traditional content organized by disease.
2. A completely revised Psychiatry chapter incorporating the DSM-V in a quick-to-reference and readable format.
3. The Toronto Notes Quiz App, which is available for free on iTunes and Google Play. This app contains hundreds of questions allowing users to test themselves on the content contained within Toronto Notes.
4. A significantly improved interactive eBook with many new high-quality colour images.
5. A brand-new Clinical Handbook that is more concise, has numerous new figures, and features approaches to hundreds of common clinical situations.

Toronto Notes 2017 is produced by Toronto Notes for Medical Students Inc., which is a non-for-profit organization supporting various charity organizations in the city of Toronto. This year Toronto Notes for Medical Students has supported organizations including medical school clubs, community outreach groups, student bursaries and scholarships, and the Canadian Cancer Society. Your purchase of Toronto Notes 2017 is much appreciated by these well-deserving groups.

We would like to highlight the exceptional work of our team, composed of over 150 medical students, medical illustrators/artists, and faculty members at the University of Toronto Faculty of Medicine. Without the tireless effort expended by these individuals the production of Toronto Notes 2017 would not have been possible. In particular, we would like to highlight the work of the executive team, all of whom made personal sacrifices in balancing their clinical and academic duties with the responsibilities asked of them: our production managers, Tina Binesh Marvasti and Sydney McQueen, our associate editors, Narayan Chattergoon, Desmond She, Claudia Frankfurter, Inna Gong, Dhruvin Hirpara, and Sneha Raju, and our EBM editors, Arnav Agarwal, Quynh Huynh, Robert Vanner, Brittany Prevost, Simran Mundi, and Valerie Lemieux. We also want to highlight the work of Rajkumari Chatterjee from University of Toronto Bookstore, who has contributed to the production of Toronto Notes for the past ten years, and has been instrumental in the annual launch of the Toronto Notes Ebook. Lastly, we would like to thank our partners at Type & Graphics Inc., particularly Enrica Aguilera, for their assistance during the production of Toronto Notes 2017.

We hope that Toronto Notes 2017 enhances your medical knowledge and allows you to perform better on both your clinical rotations and licensing exams. We continue to encourage feedback – this year, we have read and incorporated every piece of feedback we received regarding the previous edition of Toronto Notes. On behalf of the Toronto Notes 2017 team, we wish you success in your studies and academic endeavours.

Sincerely,

Jieun Kim, MSc, MD/PhD Candidate and
Ilya Mukovozov, MSc, PhD, MD Candidate
Editors-in-Chief, Toronto Notes 2017
MD Program, University of Toronto
Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 33rd edition of this text was made possible with their contributions.

How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of Toronto Notes allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Icon Name</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Key Objectives</td>
<td>This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.</td>
</tr>
<tr>
<td></td>
<td>Clinical Pearl</td>
<td>This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.</td>
</tr>
<tr>
<td></td>
<td>Memory Aid</td>
<td>This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.</td>
</tr>
<tr>
<td></td>
<td>Clinical Flag</td>
<td>This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.</td>
</tr>
<tr>
<td></td>
<td>Cross-Reference</td>
<td>This icon is found in sidebars of the text. It indicates a cross-reference for information that is discussed in a separate chapter.</td>
</tr>
<tr>
<td></td>
<td>Evidence Based Medicine</td>
<td>This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text.</td>
</tr>
<tr>
<td></td>
<td>Colour Photo Atlas</td>
<td>This icon is found next to headings in the text. It indicates topics that correspond with images found in the Colour Photo Atlas available online (<a href="http://www.torontonotes.ca">www.torontonotes.ca</a>).</td>
</tr>

Chapter Divisions
To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

**Basic Anatomy/Physiology Review**
- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

**Common Differential Diagnoses**
- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

**Diagnoses**
- the bulk of the book
  - etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

**Common Medications**
- a quick reference section for review of medications commonly prescribed
**Common Unit Conversions**

To convert from the conventional unit to the SI unit, **multiply** by conversion factor.

To convert from the SI unit to the conventional unit, **divide** by conversion factor.

Further information on these topics can be found in the Objectives of the Considerations of the Legal, Ethical and Organizational Aspects of the Practice of Medicine (CLEO) – which can be downloaded free of charge from the Medical Council of Canada website at http://mcc.ca/wp-content/uploads/CLEO.pdf

Canadian law applicable to medical practice varies between jurisdictions and changes over time. Criminal law is nationwide, but non-criminal (civil) law varies between provinces. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.
The Canadian Health Care System

Overview of Canadian Health Care System

- one federal, three territorial, and ten provincial systems
- major complexities involved in establishment of Canadian health policy include geographical diversity, socioeconomic divisions, and international pressures
- financed by both the public (70%) and private (30%) sectors
- each provincial plan must cover all medically necessary health services delivered in hospitals and by physicians; may choose to cover services such as home care and prescription drugs
- non-insured health services and fees are either covered by private insurance or by the individual
- workers’ compensation funds cover treatment for work-related injuries and diseases

Legal Foundation

- the legal foundation of the Canadian health system is based on two constitutional documents:
  1. Constitution Act (1867): deals primarily with the jurisdictional power between federal and provincial governments
  2. The Canadian Charter of Rights and Freedoms (1982): does not guarantee a right to health care but, given government’s decision to finance health care, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians’ mobility rights, etc.)

- and two statutes:
  1. Canada Health Act (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
  2. Canada Health and Social Transfer Act (1996): federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces’ discretion

History of the Canadian Health Care System

1867 British North America Act (now Constitution Act) establishes Canada as a confederacy

1965 Royal Commission on Health Services (Hall Commission) recommends federal leadership and financial support with provincial government operation
Canada Health Act passed by federal government
- replaces Medical Care Act (1966) and Hospital Insurance and Diagnostic Services Act (1957)
- provides federal funds to provinces with universal hospital insurance
- maintains federal government contribution at 50% on average, with poorer provinces receiving more funds
- medical insurance must be 'comprehensive, portable, universal, and publicly administered'
- bans extra-billing by new fift criterion: accessibility

Canada Health and Social Transfer Act passed by federal government
- federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion

Kirby and Romanow Commissions appointed
- Kirby Commission (final report, October 2002)
  - examines history of health care system in Canada, pressures and constraints of current health care system, role of federal government, and health care systems in foreign jurisdictions
- Romanow Commission (final report, November 2002)
  - dialogue with Canadians on the future of Canada’s public health care system

First Ministers’ Meeting on the Future of Health Care produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and primary care reform

Choulli v. Québec, Supreme Court of Canada decision
- rules that Québec’s banning of private insurance is unconstitutional under the Québec Charter of Rights, given that patients do not have access to those services under the public system in a timely way

First progress report by the Health Council reviews progress (2004 First Ministers’ 10 year plan)
- significant reductions in wait times for specific areas (such as cancer, joint replacement and sight restoration), but may have inadvertently caused increases in wait times of other services
- despite large investments into EMRs, Canada continues to have very low uptake, ranking last in the Commonwealth Fund International Health Policy survey, with only 37% use among primary care physicians
- little progress in creating a national strategy for equitable access to pharmaceuticals; however, there has been some success in increasing pharmacists’ scope of practice, reducing generic drugs costs, and implementing drug info systems
- increases in funding to provinces at 6% per annum until the 2016-2017 fiscal year; from then onwards, increases tied to nominal GDP at a minimum of 3% per annum

Second progress report by the Health Council reviews progress towards 2004 First Ministers’ 10 year plan
- funding is sufficient; however, more innovation is needed including incentivizing through models of remuneration
- 46 recommendations made to address the lack of progress

Health Care Expenditure and Delivery in Canada
- projected total health care expenditure in 2014 was $214.9 billion, 11% of the GDP, approximately $6,045 CDN per person

Sources of Health Care Funding
- 71% of total health expenditure in 2015 came from public-sector funding with 66% coming from the provincial and territorial governments and 5% from other parts of the public sector: federal direct government, municipal, and social security funds. 29% is from private sources including out of pocket (14%), private insurance (12%) and other (3%)
- public sector covers services offered on a either a fee for service, capitation, or alternate payment plan in physicians’ offices and in hospitals
- public sector does not cover services provided by privately practicing health professionals (e.g. dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists, podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC drugs, personal health supplies, and use of residential care facilities
Delivery of Health Care

- hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities
- other countries, such as the United States (a mix of public and private funding, as well as private for-profit and private not-for-profit delivery) and the United Kingdom (primarily public funding and delivery) have different systems of delivery

Physician Licensure and Certification

- physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation
- self-regulation is based on the premise that the licensing authority must act first and foremost in the interest of the public

Table 2. Key Physician Certification and Licensing Bodies in Canada

<table>
<thead>
<tr>
<th>Certifying Body</th>
<th>Description</th>
</tr>
</thead>
</table>
| MCC             | Certifies physicians with the LMCC  
The LMCC is acquired by passing the MCC Qualifying Examination Parts I and II |
| RCPSC           | Certifies specialists who complete an accredited residency program and pass the appropriate exam  
Voluntary membership of the RCPSC is designated FRCPC or FRSC |
| CFPC            | Certifies family physicians who complete an accredited residency program and pass the Certification Examination in Family Medicine |

<table>
<thead>
<tr>
<th>Licensing Body</th>
<th>Description</th>
</tr>
</thead>
</table>
| CPSO           | Membership to the provincial licensing authority is mandatory  
Licensing authority functions include:  
Provide non-transferable licensure to physicians  
Maintaining ethical, legal, and competency standards and developing policies to guide doctors  
Investigating complaints against doctors  
Disciplining doctors guilty of professional misconduct or incompetence  
At times of license revocation and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses that may impact their ability to practice safely) |

- the RCPSC and CFPC are responsible for monitoring ongoing CME and professional development
- certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities

Role of Professional Associations

Table 3. Key Professional Associations

<table>
<thead>
<tr>
<th>Association</th>
<th>Description</th>
</tr>
</thead>
</table>
| CMA              | Provides leadership to doctors and advocates for access to high quality care in Canada  
Represents physician and population concerns at the national level  
Membership is voluntary |
| OMA and Other PTMAs | Negotiates fee and benefit schedules with provincial governments  
Represents the economic and professional interests of doctors  
Membership is voluntary |
| CMPA             | Physician-run organization that protects the integrity of member physicians  
Provides legal defence against allegations of malpractice or negligence  
Provides risk management and educational programs  
Membership is voluntary |
| RDoC and PHO     | Upholds economic and professional interests of residents across Canada  
Facilitates discussion amongst PHOs regarding policy and advocacy items |
| CMFS and FMEQ    | Medical students are represented at their universities by student bodies, which collectively form the CFMS or FMEQ  
The FMEQ membership includes that of francophone medical schools |
Introduction to the Principles of Ethics

- Ethics addresses:
  1. Principles and values that help define what is morally right and wrong
  2. Rights, duties, and obligations of individuals and groups
- The practice of medicine assumes there is one code of professional ethics for all doctors and that they will be held accountable by that code and its implications
- The doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- A fiduciary duty is a legal duty to act solely in another party’s interest; one may not profit from the relationship with principals unless he/she has the principal’s express consent

Table 4. The Four Principles Approach to Medical Ethics

<table>
<thead>
<tr>
<th>Principle</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autonomy</td>
<td>Recognizes an individual’s right and ability to decide for himself/herself according to his/her beliefs and values Not applicable in situations where informed consent and choice are not possible or may not be appropriate</td>
</tr>
<tr>
<td>Beneficence</td>
<td>The patient-based ‘best interests’ standard that combines doing good, avoiding harm, taking into account the patient’s values, beliefs, and preferences, so far as these are known Autonomy should be integrated with the physician’s conception of a patient’s medically-defined best interests The aim is to minimize harmful outcomes and maximize beneficial ones Paramount in situations where consent/choice is not possible or may not be appropriate</td>
</tr>
<tr>
<td>Non-Maleficence</td>
<td>Obligation to avoid causing harm; primum non nocere (“First, do no harm”) A limit condition of the Beneficence principle</td>
</tr>
<tr>
<td>Justice</td>
<td>Fair distribution of benefits and harms within a community, regardless of geography or privilege Concept of fairness: Is the patient receiving what he/she deserves – his/her fair share? Is he/she treated the same as equally situated patients? How does one set of treatment decisions impact others? Basic human rights, such as freedom from persecution and the right to have one’s interests considered and respected</td>
</tr>
</tbody>
</table>

CMA Code of Ethics

- The CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians. The Code of Ethics is:
  - Prepared by physicians for physicians and applies to physicians, residents, and medical students
  - Based on the fundamental ethical principles of medicine
  - Sources include the Hippocratic Oath, developments in human rights, recent bioethical discussion
  - CMA policy statements address specific ethical issues not mentioned by the code (e.g. abortion, transplantation, and euthanasia)

Confidentiality

Overview of Confidentiality

- A full and open exchange of information between patient and physician is central to a therapeutic relationship
- Privacy is the right of patients (which they may forego) while confidentiality is the duty of doctors (which they must respect barring patient consent or the requirements of the law)
- If inappropriately breached by a doctor, he/she can be sanctioned by the hospital, court, or regulatory authority
- Based on the ethical principle of patient autonomy, patients have the right to the following:
  - Control of their own information
  - The expectation that information concerning them will receive proper protection from unauthorized access by others (see Privacy of Medical Records, ELOM6)
- Confidentiality may be ethically and legally breached in certain circumstances (e.g. the threat of harm to others)
- Unlike the solicitor-client privilege, there is no ‘physician-patient privilege’ by which a physician, even a psychiatrist, can promise the patient absolute confidentiality
- Physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
- Many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
- Physicians failing to abide by such regulations could be subject to professional or civil actions
- The legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting cases in the common law

Confidentiality

- Disclose your patients’ personal health information to third parties only with their consent, or as provided for by law, such as when the maintenance of confidentiality would result in a significant risk of substantial harm to others or, in the case of incompetent patients, to the patients themselves. In such cases take all reasonable steps to inform the patients that the usual requirements for confidentiality will be breached

Legal Aspects of Confidentiality

- Advice should always be sought from provincial licensing authorities and/or legal counsel when in doubt

CMA Code of Ethics

- The CMA Code of Ethics is a quasi-legal standard for physicians; if the law sets a minimal moral standard for doctors, the Code augments these standards
Statutory Reporting Obligations
- legislation has defined specific instances where public interest overrides the patient's right to confidentiality; varies by province, but may include
  1. suspected child abuse or neglect – report to local child welfare authorities (e.g. Children's Aid Society)
  2. fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see Geriatric Medicine, GM11)
  3. communicable diseases – report to local public health authority (see Population Health and Epidemiology, PH24)
  4. improper conduct of other physicians or health professionals – report to College or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
  5. vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 days to Office of Registrar General or local municipality; death certificates must be completed by a MD then forwarded to municipal authorities)
  6. reporting to coroners (see Physician Responsibilities Regarding Death, ELOM14)

- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

Duty to Protect/Warn
- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detention of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm
- first established by a Supreme Court of California decision in 1976 (Tarasoff v. Regents of the University of California); supported by Canadian courts
- obliged by the CMA Code of Ethics and recognized by some provincial/territorial regulatory authorities
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where
  1. there is a clear risk to identifiable person(s);
  2. there is a risk of serious bodily harm or death; and
  3. the danger is imminent (i.e. more likely to occur than not)

Disclosure for Legal Proceedings
- disclosure of health records can be compelled by a court order, warrant, or subpoena

Privacy of Medical Records
- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the Canadian Charter of Rights and Freedoms, and the physician's fiduciary duty
- the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, private labs)
- PIPEDA has been superseded by provincial legislation in many provinces, such as the Ontario Personal Health Information Protection Act, which applies more specifically to health information

Duties of Physicians with Respect to the Privacy of Health Information
- inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
  - under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between health care team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box"
  - provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
  - provide secure storage of information and implement measures to limit access to patient records
  - ensure proper destruction of information that is no longer necessary
  - regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces

Consent and Capacity

Ethical Principles Underlying Consent and Capacity
- consent is the autonomous authorization of a medical intervention by a patient
- usually the principle of respect for patient autonomy overrides the principle of beneficence
- where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding the patient's values, beliefs, and cultural or religious background
- more recently expressed wishes take priority over remote ones
• patient wishes may be verbal or written
• patients found incapable to make a specific decision should still be involved in that decision as much as possible
• agreement or disagreement with medical advice does not determine findings of capacity/incapacity
• however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed

Four Basic Requirements of Valid Consent
1. Voluntary
   • consent must be given free of coercion or pressure (e.g. from parents or other family members who might exert ‘undue influence’)
   • the physician must not deliberately mislead the patient about the proposed treatment

2. Capable
   • the patient must be able to understand and appreciate the nature and effect of the proposed treatment

3. Specific
   • the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)

4. Informed
   • sufficient information and time must be provided to allow the patient to make choices in accordance with his/her wishes, including
     • the nature of the treatment or investigation proposed and its expected effects
     • all significant risks and special or unusual risks
     • alternative treatments or investigations and their anticipated effects and significant risks
     • the consequences of declining treatment
     • risks that are common sense need not be disclosed (i.e. bruising after venipuncture)
     • answers to any questions the patient may have
   • the reasonable person test – the physician must provide all information that would be needed “by a reasonable person in the patient’s position” to be able to make a decision
   • disclose common adverse events (>1/200 chance of occurrence) and serious risks (e.g. death), even if remote
   • it is the physician’s responsibility to make reasonable attempts to ensure that the patient understands the information
   • physicians should not withold information about a legitimate therapeutic option based on personal conscience (e.g. not discussing the option of emergency contraception)

---

**Figure 2. Ontario consent flowchart**

Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

CCB = consent and capacity board; SDM = substitute decision-maker
Obtaining Legal Consent
- Consent of the patient must be obtained before any medical intervention is provided; consent can be:
  - Verbal or written, although written is usually preferred
  - A signed consent form is only evidence of consent—it does not replace the process for obtaining valid consent
  - What matters is what the patient understands and appreciates, not what the signed consent form states
  - Implied (e.g., a patient holding their arm for an immunization) or expressed
- Consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm
- HCAA of Ontario (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g., home care)

Exceptions to Consent
1. Emergencies
   - Treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
   - Emergency treatment should not violate a prior expressed wish of the patient (e.g., a signed Jehovah’s Witness card)
   - If patient is incapable, MD must document reasons for incapacity and why situation is emergent
   - Patients have a right to challenge a finding of incapacity as it removes their decision-making ability
   - If a SDM is not available, MD can treat without consent until the SDM is available or the situation is no longer emergent

2. Legislation
   - Mental Health legislation allows for:
     - The detention of patients without their consent
     - Psychiatric outpatients may be required to adhere to a care plan in accordance with Community Treatment Orders (see Psychiatry, PS51)
   - Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g., a patient with TB refusing to take medication) to prevent transmission of communicable diseases

3. Special situations
   - Public health emergencies (e.g., an epidemic or communicable disease treatment)
   - Warrant for information by police

Consequences of Failure to Obtain Valid Consent
- Treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in exceptions section above)
- Treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
- The onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

Overview of Capacity
- Capacity is the ability to:
  - Understand information relevant to a treatment decision
  - Appreciate the reasonably foreseeable consequences of a decision or lack of a decision
  - Capacity is specific for each decision (e.g., a person may be capable to consent to having a chest x-ray, but not for a bronchoscopy)
  - Capacity can change over time (e.g., temporary incapacity secondary to delirium)
  - Most Canadian jurisdictions distinguish capacity to make healthcare decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
  - A person is presumed capable unless there is good evidence to the contrary
  - Capable patients are entitled to make their own decisions
  - Capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

Assessment of Capacity
- Capacity assessments must be conducted by a physician and, if appropriate, in consultation with other healthcare professionals (e.g., another physician, a mental health nurse)
- Clinical capacity assessment may include:
  - Specific capacity assessment (i.e., capacity specific to the decision at hand)
    1. Effective disclosure of information and evaluation of patient’s reason for decision
    2. Understanding of:
       - His/her condition
       - The nature of the proposed treatment
       - Alternatives to the treatment
       - The consequences of accepting and rejecting the treatment
       - The risks and benefits of the various options
3. for the appreciation needed for decision making capacity, a person must
– acknowledge the condition that affects him/herself
– be able to assess how the various options would affect him or her
– be able to reach a decision and adhere to it, and make a choice, not based primarily upon
delusional belief
  ▪ general impressions
  ▪ input from psychiatrists, neurologists, etc.
  ▪ employ “Aid to Capacity Evaluation”
  ▪ a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in
    Ontario, the Consent and Capacity Review Board), or the courts
  ▪ judicial review is open to patients if found incapable

Treatment of the Incapable Patient in a Non-Emergent Situation
• obtain informed consent from SDM
  • an incapable patient can only be detained against his/her will to receive treatment if he/she
    meets criteria for certification under the Mental Health Act (see Psychiatry, PSS1); in such a
    situation:
      ▪ document assessment in chart
      ▪ notify patient of assessment using appropriate Mental Health Form(s) (Form 42 in Ontario)
      ▪ notify Rights Advisor

Substitute Decision-Makers
• SDMs must follow the following principles when giving informed consent:
  ▪ act in accordance with wishes previously expressed by the patient while capable
  ▪ if wishes unknown, act in the patient's best interest, taking the following into account:
    1. values and beliefs held by the patient while capable
    2. whether well-being is likely to improve with vs. without treatment
    3. whether the expected benefit outweighs the risk of harm
    4. whether a less intrusive treatment would be as beneficial as the one proposed
  ▪ the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM
    is not abiding by the above principles

Instructional Advance Directives
• allow patients to exert control over his/her care once they are no longer capable
  • the patient sets out his/her decisions about future health care, including who he/she would allow to
    make treatment decisions on his/her behalf and what types of interventions he/she would want
  • takes effect once the patient is incapable with respect to treatment decisions
  • in Ontario, a person can appoint a power of attorney for personal care to carry out his/her advance
directives
  • patients should be encouraged to review these documents with their family and physicians and to
    reevaluate them often to ensure they are current with their wishes

POWERS OF ATTORNEY
• all Guardians and Attorneys have fiduciary duties for the dependent person

Definitions
• Power of Attorney for Personal Care
  ▪ a legal document in which one person gives another the authority to make personal care decisions
    (health care, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they become mentally
    incapable
• Guardian of the Person
  ▪ someone who is appointed by the Court to make decisions on behalf of an incapable person in some
    or all areas of personal care, in the absence of a POA for personal care
• Continuing Power of Attorney for Property
  ▪ a legal document in which a person gives another the legal authority to make decisions about their
    finances if they become unable to make those decisions
• Guardian of Property
  ▪ someone who is appointed by the Public Guardian and Trustee or the Courts to look after an
    incapable person’s property or finances
• Public Guardian and Trustee
  ▪ acts as a SDM of last resort on behalf of mentally incapable people who do not have another
    individual to act on their behalf
• Pediatric Aspects of Capacity Covered
  ▪ no age of consent in all provinces and territories except Québec; consent depends on patient’s
    decision-making capacity
  ▪ Quebec has a specific age of consent, but common law and case law deem underage legal minors
    capable, allowing them to make their own choices
  ▪ infants and children are assumed to lack mature decision-making capacity for consent but they
    should still be involved (i.e. be provided with information appropriate to their comprehension level)
Ethical and Legal Issues in Canadian Medicine

Negligence

Ethical Basis
• the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
• negligence or malpractice is a form of failure on the part of the physician in fulfilling his/her fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

Legal Basis
• physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances
• standard/duty of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing
• liability arises from physician’s common law duty of care to his/her patients in the doctor/patient relationship (or, in Québec, from the Civil Code provisions regarding general civil liability)
• action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective province in which the actions occurred

Truth-Telling

Ethical Basis
• helps to promote and maintain a trusting physician-patient relationship
• patients have a right to be told important information that physicians have regarding their care
• enables patients to make informed decisions about health care and their lives

Legal Basis
• required for valid patient consent (see Consent and Capacity, ELOM6)
  • goal is to disclose information that a reasonable person in the patient’s position would need in order to make an informed decision ("standard of disclosure")
  • withholding information can be a breach of fiduciary duty and duty of care
  • obtaining consent on the basis of misleading information can be seen as negligent

Evidence about Truth-Telling
• most patients want to know what is wrong with them
• although many patients want to protect family members from bad news, they themselves would want to be informed in the same situation
• truth-telling improves adherence and health outcomes
• informed patients are more satisfied with their care
• negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

Challenges in Truth-Telling

Medical Error
• medical error may be defined as ‘preventable adverse events (AEs)’ caused by the patient’s medical care and not the patient’s underlying illness; some errors may be identified before they harm the patient, so not all error is truly ‘adverse’
• many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient’s family and reported to the appropriate health authorities
• physicians should disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  • negligence is a legal determination
  • error is not equal to negligence (see Negligence)
• disclosure allows the injured patient to seek appropriate corrective treatment promptly
• physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
• physicians should offer apologies or empathic expressions of regret (e.g. “I wish things had turned out differently”) as these can increase trust and are not admissions of guilt or liability
• Apology Acts across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

Errors of care are compatible with non-negligent care if they are ones that a reasonably cautious and skilled MD could make (i.e. mistakes can be made due to ‘honest error’)

Four basic elements for action against a physician to succeed in negligence:
1. A duty of care owed to the patient (i.e. doctor/patient relationship must be established)
2. A breach of the standard of care
3. Some harm or injury to the patient
4. The harm or injury must have been caused by the breach of the duty of care

CPSO Policy on Truth-Telling
Physicians should provide patients with whatever information will, from the patient’s perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient

Adverse Event
An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

Open Disclosure of AEs: Transparency and Safety in Health Care
Health care providers have a fiduciary duty to disclose AEs to their patients. Professional societies codify medical providers’ ethical requirement to disclose AEs to patients in accordance with the four principles of biomedical ethics. Transparency and honesty in relationships with patients create opportunities for learning that lead to systems improvements in health care organizations. Disclosure invariably becomes a component of broad systems improvement and is closely linked to improving patient safety.

Examples of Warning of Impending Bad News
“I have something difficult to tell you…”
“This may come as a shock to you, but the tests indicate…”
“There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem…”
Breaking Bad News
- "bad news" may be any information that reveals conditions or illnesses threatening the patient's sense of well-being
- caution patients in advance of serious tests about possible bad findings
- give warnings of impending bad news and make sure you provide time for the patient
- poorly done disclosure may be as harmful as non-disclosure
- truth-telling may be a process requiring multiple visits
- adequate support should be provided along with the disclosure of difficult news
- SPIKES protocol was developed to facilitate “breaking bad news”

Arguments Against Truth-Telling
- may go against certain cultural norms and expectations
- may lead to patient harm and increased anxiety
- 10–20% of patients prefer not to be informed
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

Exceptions to Truth-Telling
- a patient may waive his/her right to know the truth about their situation (i.e. decline information that would normally be disclosed) when
  - the patient clearly declines to be informed
  - a strong cultural component exists that should be respected and acknowledged
  - the patient may wish others to be informed and make the medical decisions for him/her
  - the more weighty the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
  - ‘emergencies’: an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
  - ‘therapeutic privilege’
  - withholding of information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress or physical harm to the patient
  - clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones and is a defence of non-disclosure that is rarely accepted anymore
  - it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

Ethical Issues in Health Care

Managing Controversial and Ethical Issues in Practice
- discuss in a non-judgmental manner
- ensure patients have full access to relevant and necessary information
- identify if certain options lie outside of your moral boundaries and refer to another physician if appropriate
- consult with appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

Reproductive Technologies

Overview of the Maternal-Fetal Relationship
- in general, maternal and fetal interests align
- in some situations, a conflict between maternal autonomy and the best interests of the fetus may arise

Ethical Issues and Arguments
- principle of reproductive freedom: women have the right to make their own reproductive choices
- coercion of a woman to accept efforts to promote fetal well-being is an unacceptable infringement of her personal autonomy

Legal Issues and Arguments
- the law upholds a woman’s right to life, liberty, and security of person, and does not recognize fetal rights; key aspects of the mother's rights include
  - if a woman is competent and refuses medical advice, her decision must be respected even if the fetus will suffer
  - the fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

Royal Commission on New Reproductive Technologies (1993) recommendations:
1. medical treatment must never be imposed upon a competent pregnant woman against her wishes
2. no law should be used to confine a pregnant woman in the interest of her fetus
3. the conduct of a pregnant woman in relation to her fetus should not be criminalized
4. child welfare should never be used to control a woman's behaviour during pregnancy
5. civil liability should never be imposed upon a woman for harm done to her fetus during pregnancy
Examples involving the use of established guidelines
• a woman is permitted to refuse HIV testing during pregnancy, even if vertical transmission to fetus results
• a woman is permitted to refuse Caesarean section in labour that is not progressing, despite evidence of fetal distress

Advanced Reproductive Therapies
• includes non-coital insemination, hormonal ovarian stimulation, and IVF
• topics with ethical concerns
  ■ donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  ■ preimplantation genetic testing for diagnosis before pregnancy
  ■ use of new techniques without patients appreciating their experimental nature
  ■ embryo status – the Supreme Court of Canada maintains that fetuses are “unique” but not persons under law; this view would likely apply to embryos as well
  ■ access to ART
  ■ private vs. public funding of ART
  ■ social factors limiting access to ART (e.g. same-sex couples)
  ■ the ‘commercialization’ of reproduction

Fetal Tissue
• pluripotent stem cells can currently be derived from human embryonic and fetal tissue
• potential uses of stem cells in research
  ■ studying human development and factors that direct cell specialization
  ■ evaluating drugs for efficacy and safety in human models
  ■ cell therapy: using stem cells grown in vitro to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson’s disease)
  ■ genetic treatment aimed at altering somatic cells (e.g. myocardial or immunological cells) is acceptable and ongoing

Induced Abortion
• CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA)
• CMA policy on induced abortion
  1. induced abortion should not be used as an alternative to contraception
  2. counselling on contraception must be readily available
  3. full and immediate counselling services must be provided in the event of unwanted pregnancy
  4. there should be no delay in the provision of abortion services
  5. no patient should be compelled to have a pregnancy terminated
  6. physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician
  7. no discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do
  8. induced abortion should be uniformly available to all women in Canada and health care insurance should cover all the costs (note: the upper limit of GA for which coverage is provided varies between provinces)
  9. elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances

Ethical and Legal Concerns and Arguments
• no law currently regulates abortion in Canada
• it is a woman’s medical decision to be made in consultation with whom she wishes; there is no mandatory role for spouse/family
• 2nd and even 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the woman’s health, or if the fetus has died in utero or has major malformations (e.g. anencephaly)

Prenatal/Antenatal Genetic Testing
• uses
  1. to confirm a clinical diagnosis
  2. to detect genetic predisposition to a disease
  3. allows preventative steps to be taken and helps patient prepare for the future
  4. gives parents the option to terminate a pregnancy or begin early treatment
• ethical dilemmas arise because of the sensitive nature of genetic information; important considerations of genetic testing include:
  ■ the individual and familial implications
  ■ its pertinence to future disease
  ■ its ability to identify disorders for which there are no effective treatments or preventive steps
  ■ its ability to identify the sex of the fetus
• ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
  ■ obtaining informed consent is difficult due to the complexity of genetic information
  ■ doctor’s duty to maintain confidentiality vs. duty to warn family members
  ■ risk of social discrimination (e.g. insurance) and psychological harm
Legal Aspects
- no current specific legislation exists
- testing requires informed consent
- no standard of care exists for clinical genetics, but physicians are legally obligated to inform patients that prenatal testing exists and is available
- a physician can breach confidentiality terms in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention (e.g. familial adenomatous polyposis, Gastroenterology, G34)

Genetic Testing: Ethically Appropriate Actions
- thorough discussion and realistic planning with patient before testing is done
- genetic counselling for delivery of complex information

End-of-Life Care

Overview of Palliative and End-of-Life Care
- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
- appropriate for any patient at any stage of a serious or life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

Euthanasia and Physician-Assisted Suicide
- **euthanasia**: a deliberate act undertaken by one person with the intention of ending the life of another person to relieve that person's suffering, where the act is the cause of death
- **physician-assisted suicide**: the act of intentionally killing oneself with the assistance of a physician who deliberately provides the knowledge and/or the means

Common Ethical Arguments/Opinions
- patient has the right to make autonomous choices about the time and manner of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and forgoing life-sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering
- patient autonomy has limits
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death

Legal Aspect
- in Canada, euthanasia is no longer a punishable offence under the Criminal Code of Canada
- in the Carter v. Canada decision of February 2015, physician-assisted suicide ruled to be not criminal, with the decision taking effect in 2016, now postponed to June 2016
- until June 2016, applicants for assistance in dying (MAID - 'Medical Aid in Dying') must obtain court sanction (as an exemption to the Criminal Code)

Criteria for MAID
- grievously and irreversibly ill / injured
- suffering intolerable to the patient
- not treatable by means acceptable to the patient
- adult, competent patient, clear and freely given consent

Acceptable Use of Palliative and End-of-Life Care
- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its 'natural course' but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from SDMs, as ruled in Cuthbertson v. Rasouli in 2013, as palliative care would be instituted and consent for that would require SDM consent
- refusals of care by the patient that may lead to death as well as requests for a hastened death, ought to be carefully explored by the physician to rule out any 'reversible factors' (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice
Physician Responsibilities Regarding Death
- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- Coroners Act, 1990 (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy
  - suddenly and unexpectedly
  - from disease which was not treated by a legally qualified medical practitioner
  - from any cause other than disease
  - under suspicious circumstances
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility
- unclear as yet whether physicians who object to MAID on grounds of conscience will have to refer to willing physicians and also unclear what patients seeking MAID in religious affiliated hospitals will do

Physician Competence and Professional Conduct

CanMEDS Competencies (Ethical/Policy Statement)
- a framework of professional competencies established by the MCC as objectives for the MCC Qualifying Exam
- further information on MCC objectives can be found at www.mcc.ca

Legal Considerations
- physicians’ conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g. the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within his/her medical practice
- the ultimate constraint on MD behaviour as regards to unprofessionalism is ‘conduct unbecoming physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within his/her medical practice

Common Policies on Physician Conduct
- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and provincial governing body. Important notes on this topic include:
  - inappropriate sexual conduct includes intercourse, undue touching, references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in specified situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
  - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
  - in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Code of Ethics)
- physicians must maintain adequate records for each patient, which include:
  - demonstration that care has been continuous and comprehensive
  - minimal standards for record-keeping, including readability, diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record, including drugs, a Cumulative Patient profile, all aspects of charting that are required for safe patient care (full standards available at www.cpsso.on.ca). Another physician should be able to take over the safe care of the patient based on the record
  - records stored for 10 years in most jurisdictions
  - although the medical record is the property of the physician or an institution, the patient or the patient's delegate must be allowed full access to information in the medical record in a reasonable period of time, and can charge a reasonable fee, upon (usually written) request
  - in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

Notify Coroner if Death Occurs due to:
- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances

CanMEDS Competencies
- Communicator
- Collaborator
- Health Advocate
- Leader
- Professional
- Scholar
- Medical Expert

CPSO Policy: Treating Self and Family Members
Physicians will not diagnose or treat themselves or family members except for minor conditions or in emergencies and then only if no other physician is readily available

CPSO Policy: Ending the Physician-Patient Relationship
Discontinuing services that are needed is an act of professional misconduct unless done by patient request, alternative services are arranged, or adequate notice has been given

CMA Code of Ethics
Report any unprofessional conduct by colleagues to the appropriate authority
Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
  - major ethical dilemmas arise when a participant’s obligation to the patient comes into conflict with other obligations and incentives
- any exceptions to disclosure for therapeutic consent do not apply in an experimental situation
- important ethical principles to consider when conducting research on human subjects were laid out in the Declaration of Helsinki, the Belmont Report, and the Tri-Council Policy Statement: Ethical Conduct on Research Involving Human Subjects

Table 5. Ethical Principles for Research Involving Human Subjects

<table>
<thead>
<tr>
<th>Principle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Right to Privacy</td>
<td>Patient’s voluntary and informed choice is usually required, except in special circumstances (i.e. chart reviews without patient contact) or unexpected situations for which there is no agreed or helpful standard of care and the proposed intervention is not likely to cause more harm than such patients already face</td>
</tr>
<tr>
<td>Right to a Safe Research Environment</td>
<td>Access to the treatment that is considered standard (i.e. placebo-controlled trials are generally acceptable where patients all receive the standard of care, or, if not, are informed about the placebo arm and what that entails)</td>
</tr>
<tr>
<td>Right to知情</td>
<td>Must employ a scientifically valid design to answer the research question (ensured via peer review, expert opinion)</td>
</tr>
<tr>
<td>Right to a Procedure that Works</td>
<td>Must demonstrate sufficient value to justify any risk posed to participants</td>
</tr>
<tr>
<td>Right to an Accurate Procedure</td>
<td>Must be conducted honestly (i.e. carried out as stated in the approved protocol)</td>
</tr>
<tr>
<td>Right to be Involved in Research</td>
<td>Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions</td>
</tr>
<tr>
<td>Right to Be Informed about Potential Risks</td>
<td>Patients must not be enticed into risky research by the lure of money and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts</td>
</tr>
<tr>
<td>Right to Be Informed about the Ongoing Trial</td>
<td>Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial</td>
</tr>
</tbody>
</table>

Physician-Industry Relations

- health care delivery in Canada involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (i.e. product samples)
- physicians have a responsibility to ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society
- gifts or free products from the pharmaceutical industry are usually inappropriate
- sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance
- physicians receiving such sponsorship must disclose this at presentations and/or in written articles

Resource Allocation

- definition: the distribution of goods and services to programs and people
- physicians have the duty to inform patients about therapeutic options even if they are not available
- physicians must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
  - need and benefit are morally relevant criteria for resource allocation
  - gender, sexual orientation, religion, level of education, or age alone are morally irrelevant criteria
  - ethical dilemmas that arise when deciding how best to allocate resources
  - fair chances versus best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
  - priorities problem: how much priority should the sickest patients receive?
  - aggregation problem: modest benefits to many vs. significant benefits to few
  - democracy problem: when to rely on a fair democratic process to arrive at a decision

Guidelines for Appropriately Allocating Resources

- the physician’s primary obligation is to:
  - protect and promote the welfare and best interests of his/her patients
  - choose interventions known to be beneficial on the basis of evidence of effectiveness
  - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
  - advocate for one’s patients, but avoid manipulating the system to gain unfair advantage for them
  - resolve conflicting claims for scarce resources jointly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defendable procedures
  - inform patients of the impact of cost constraints on care, but in a sensitive way
  - seek resolution of unacceptable shortages at the level of hospital management or government
Conscientious Objection

Patients Refusing Treatment
• in accordance with the principle of autonomy, it is generally acceptable for competent patients to refuse medical interventions for themselves or others, although exceptions may occur
• if parents or SDMs make decisions that are clearly not in the “best interests” of an incapable child, physicians may have ethical grounds for administering treatment, depending on the acuity of the clinical situation
  • in high-acuity scenarios (e.g., refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child’s best interests
  • in lower acuity scenarios (e.g., refusing childhood immunization in a developed nation) there is a stronger obligation to respect the autonomy of the decision-makers
• physicians healing (in conjunction or in the place of standard biomedical therapy) is legally considered a constitutionally protected right, which can be made by a SDM, as ruled in Hamilton Health Sciences v. DH in 2014

Physicians Refusing to Provide Treatment
• physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere (e.g., a pediatrician who refuses to treat an unvaccinated child should refer the family to another practice)

Overview of Anesthesia

- anesthesia: lack of sensation/perception

**approach to anesthesia**

1. pre-operative assessment
2. patient optimization
3. plan anesthetic
4. post-operative care

**Types of Anesthesia**

- **general**
  - general anesthesia (GA)
  - total IV anesthesia (TIVA)

- **regional**
  - spinal, epidural
  - peripheral nerve block
  - IV regional

**Pre-Operative Assessment**

**Purpose**

- identify concerns for medical and surgical management of patient
- allow for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

**History and Physical**

**History**

- age, gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, medications, drug allergies, post-operative N/V
- FHx: abnormal anesthetic reactions, malignant hyperthermia, pseudocholinesterase deficiency (*see Uncommon Complications, A28*).
**PMHx**
- CNS: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm
- CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS/NYHA class (Cardiology and Cardiac Surgery, C35 sidebar for NYHA Classification)
- respiratory: smoking, asthma, COPD, recent upper respiratory tract infection, sleep apnea
- GI: GERD, liver disease, NPO status
- renal: insufficiency, dialysis, chronic kidney disease
- hematologic: anemia, coagulopathies, blood dyscrasias
- MSK: conditions associated with difficult intubations – arthritides (e.g. rheumatoid arthritis), cervical tumours, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery, Trisomy 21, scleroderma, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
- endocrine: DM, thyroid disorders, adrenal disorders
- other: morbid obesity, pregnancy, ethanol/other drug use

**Physical Exam**
- weight, height, BP, pulse, respiratory rate, oxygen saturation
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment is done to determine intubation difficulty (no single test is specific or sensitive) and ventilation difficulty
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion (“sniffing position”)
  - Mallampati classification
    - “3-2-1 rule”
      - thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
      - mouth opening (<2 finger breadths associated with difficult intubation)
      - anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
  - tongue size
  - dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – pose aspiration risk if dislodged and must inform patients of rare possibility of damage
  - nasal passage patency (if planning nasotracheal intubation)
  - assess potential for difficult ventilation
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, central venous pressure (CVP), and pulmonary artery (PA) catheters

---

**Figure 1. Mallampati classification of oral opening**
Pre-Operative Investigations

- routine pre-operative investigations are only necessary if there are comorbidities or certain indications

Table 1. Suggested Indications for Specific Investigations in the Pre-Operative Period

<table>
<thead>
<tr>
<th>Test</th>
<th>Indications</th>
</tr>
</thead>
<tbody>
<tr>
<td>CBC</td>
<td>Major surgery requiring group and screen or cross and match; chronic cardiovascular, pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient &gt; 1 yr of age</td>
</tr>
<tr>
<td>Sickle Cell Screen</td>
<td>Patients from geographic areas with high prevalence of sickle cell disease and/or genetically predisposed patients (hemoglobin electrophoresis if screen is positive)</td>
</tr>
<tr>
<td>INR, aPTT</td>
<td>Anticoagulant therapy, bleeding diathesis, liver disease</td>
</tr>
<tr>
<td>Electrolytes and Creatinine</td>
<td>Hypertension, renal disease, DM, pituitary or adrenal disease; vascular disease, digoxin, diuretic, or other drug therapies affecting electrolytes</td>
</tr>
<tr>
<td>Fasting Glucose Level</td>
<td>DM (repeat on day of surgery)</td>
</tr>
<tr>
<td>Pregnancy (β-hCG)</td>
<td>Women of reproductive age</td>
</tr>
<tr>
<td>ECG</td>
<td>Heart disease, DM, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma</td>
</tr>
<tr>
<td>Chest Radiograph</td>
<td>Patients with new or worsening respiratory symptoms/signs</td>
</tr>
</tbody>
</table>

American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- ASA 1: a healthy, fit patient
- ASA 2: a patient with mild systemic disease
  - e.g. controlled Type 2 DM, controlled essential HTN, obesity, smoker
- ASA 3: a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- ASA 4: a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- ASA 5: a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- ASA 6: declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

Pre-Operative Optimization

- in general, prior to elective surgery
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood and these conditions should be optimized prior to surgery
  - medications may need adjustment

Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- pre-operative medications to consider
  - prophylaxis
    - risk of GE reflux: sodium citrate and/or ranitidine and/or metoclopramide 30 min-1 h prior to surgery
    - risk of infective endocarditis, GI/GU interventions: antibiotics
    - risk of adrenal suppression: steroid coverage
    - anxiety: consider benzodiazepines
    - COPD, asthma: bronchodilators
    - CAD risk factors: nitroglycerin and β-blockers
- pre-operative medications to stop
  - oral antihyperglycemics: stop on morning of surgery
  - ACE inhibitors and angiotension receptor blockers: may stop on morning of surgery (controversial)
- warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel)
  - discuss perioperative use of ASA, NSAIDs with surgeon (± patient’s cardiologist/internist)
  - in patients undergoing non-cardiac surgery, starting or continuing low-dose aspirin in the perioperative period does not appear to protect against post-operative MI or death, but increases the risk of major bleeding
  - note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
- **pre-operative medications to adjust**
  - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

### Hypertension

- BP <180/110 is not an independent risk factor for perioperative cardiovascular complications
- target SBP <180 mmHg, DBP <110 mmHg
- assess for end-organ damage and treat accordingly

### Coronary Artery Disease

- ACC/AHA Guidelines (2014) recommend that at least 60 days should elapse after a MI before a non-cardiac surgery in the absence of a coronary intervention
  - this period carries an increased risk of re-infarction/death
  - if operative procedure is essential and cannot be delayed then invasive intra- and post-operative ICU monitoring is required to reduce the above risk
- mortality with perioperative MI is 20-50%
- perioperative β-blockers
  - may decrease cardiac events and mortality (controversial, as recent data suggests stroke risk)
  - continue β-blocker if patient is routinely taking it prior to surgery
  - consider initiation of β-blocker in
    - patients with CAD or indication for β-blocker
    - intermediate or high risk surgery, especially vascular surgery

### Respiratory Diseases

- smoking
  - adverse effects: altered mucus secretion and clearance, decreased small airway calibre, and altered immune response
  - abstain at least 8 wk pre-operatively if possible
  - if unable, abstaining even 24 h pre-operatively has been shown to increase oxygen availability to tissues
- asthma
  - pre-operative management depends on degree of baseline asthma control
  - increased risk of bronchospasm from intubation
    - administration of short course (up to 1 wk) pre-operative corticosteroids and inhaled β2-agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
  - avoid non-selective β-blockers due to risk of bronchospasm
  - cardioselective β-blockers (metoprolol, atenolol) do not increase risk of bronchospasm in the short-term
  - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
  - delay elective surgery by a minimum of 6 wk if patient develops URTI
- COPD
  - anesthesia, surgery (especially abdominal surgery, in particular upper abdominal surgery) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
  - pre-operative ABG is needed for all COPD stage II and III patients to assess baseline respiratory acidosis and plan post-operative management of hypercapnea
  - cancel/delay elective surgery for acute exacerbation

### Aspiration

- increased risk of aspiration with
  - decreased LOC
  - trauma
  - meals within 8 h
  - suspected sphincter incompetence (GERD, hiatus hernia, nasogastric tube)
  - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
  - laryngeal mask vs. endotracheal tube (ETT)
• management
  • reduce gastric volume and acidity
  • delay inhibiting airway reflexes with muscular relaxants
  • employ rapid sequence induction (see Rapid Sequence Induction, A15)

Fasting Guidelines

Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists’ Society)
• 8 h after a meal that includes meat, fried or fatty foods
• 6 h after a light meal (such as toast or crackers) or after ingestion of infant formula or non-human milk
• 4 h after ingestion of breast milk
• 2 h after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)

Hematological Disorders

• history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
• evaluate hemoglobin, hematocrit and coagulation profiles when indicated (Table 1)
• anemia
  • pre-operative treatments to increase hemoglobin (erythropoietin or pre-admission blood collection in certain populations)
• coagulopathies
  • discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA) in advance of elective surgeries
  • administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

Endocrine Disorders

• diabetes mellitus
  • clarify type 1 vs. type 2
  • clarify treatment – oral anti-hyperglycemics and/or insulin
  • assess glucose control with history and HbA1c; well controlled diabetics have more stable glucose levels intraoperatively
  • end organ damage: be aware of damage to cardiovascular, renal, and nervous systems, including autonomic neuropathy
  • formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
• hyperthyroidism
  • can experience sudden release of thyroid hormone (thyroid storm) if not treated or well-controlled preoperatively
  • treatment: β-blockers and pre-operative prophylaxis
• adrenocortical insufficiency (Addison’s, exogenous steroid use)
  • consider intraoperative steroid supplementation

Obesity and Obstructive Sleep Apnea

• assess for co-morbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
• previously undiagnosed conditions may require additional testing to characterize severity
• both obesity and OSA increase risk of difficult ventilation, intubation and post-operative respiratory complications
  • risk may be magnified with both diseases present

Monitoring

Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring
• an anesthetist present: “the only indispensable monitor”
• a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
• a perioperative anesthetic record: HR and BP every 5 min, O2 saturation, End Tidal CO2, dose and route of drugs and fluids
• continuous monitoring: see Routine Monitors for All Cases

Routine Monitors for All Cases
• pulse oximeter, BP monitor, electrocardiography and capnography are required for general anesthesia and sedation (Ramsay Sedation Scale 4–6), agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
• the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometer
Elements to Monitor
- anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, fraction of inspired O₂ (FiO₂)
- ventilation: verify correct position of ETT, chest excursions, breath sounds, ETCO₂ analysis, end tidal inhaled anesthesia analysis
- circulation: pulse, rhythm, BP, telemetry, oximetry, CVP, pulmonary capillary wedge pressure
- temperature
- hourly urine output

![Figure 2. Typical anesthesia monitor](image)

Airway Management

Airway Anatomy
- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
- the glottic opening is the space through which one visualizes proper placement of the ETT
- the trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

Methods of Supporting Airways

1. non-definitive airway (patent airway)
   - jaw thrust/chin lift
   - oropharyngeal and nasopharyngeal airway
   - bag mask ventilation
   - LMA
2. definitive airway (patent and protected airway)
   - ETT
   - surgical airway (cricothyrotomy or tracheostomy)
Table 2. Methods of Supporting the Airway

Tracheal Intubation

Preparing for Intubation
- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see Pre-Operative Assessment, A2)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O₂ for 3-5 min or for 4-8 vital capacity breaths
- may need to suction mouth and pharynx first

Proper Positioning for Intubation
- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
  - “sniffing position”: flexion of lower C-spine (CS-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air
  - contraindicated in known/suspected C-spine fracture/instability
- laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

Figure 4. Saggital view of airway with laryngoscope in vallecula
Tube Insertion
- Laryngoscopy and ETT insertion can incite a significant sympathetic response via stimulation of cranial nerves 9 and 10 due to a "foreign body reflex" in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP and coughing
- A malpositioned ETT is a potential hazard for the intubated patient
  - If too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - If too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- The tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
  - Approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women

Confirmation of Tracheal Placement of ETT
- Direct
  - Visualization of ETT passing through cords
  - Bronchoscopic visualization of ETT in trachea
- Indirect
  - ETCO2 in exhaled gas measured by capnography – a mandatory method for confirming the ETT is in the airway
  - Auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - Bilateral chest movement, condensation of water vapour in ETT visible during exhalation and no abdominal distention
  - Refilling of reservoir bag during exhalation
  - CXR (rarely done): only confirms position of the tip of ETT and not that ETT is in the trachea
  - Esophageal intubation suspected when
    - ETCO2 zero or near zero on capnograph
    - Abnormal sounds during assisted ventilation
    - Impairment of chest excursion
    - Hypoxia/cyanosis
    - Presence of gastric contents in ETT
    - Breath sounds heard when auscultating over epigastrium/LUQ
    - Distention of stomach/epigastrium with ventilation

Complications During Laryngoscopy and Intubation
- Dental damage
- Laceration (lips, gums, tongue, pharynx, vallecula, esophagus)
- Laryngeal trauma
- Esophageal or endobronchial intubation
- Accidental extubation
- Insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- Laryngospasm (see Extubation, A20 for definition)
- Bronchospasm

Difficult Airway
- Difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway or surgical airway
- Pre-operative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- If difficult airway expected, consider
  - Awake intubation
  - Intubating with bronchoscope, trachlight (lighted stylet), fibre optic laryngoscope, glidescope, etc.
- If intubation unsuccessful after induction
  1. CALL FOR HELP
  2. Ventilate with 100% O2 via bag and mask
  3. Consider returning to spontaneous ventilation and/or waking patient
- If bag and mask ventilation inadequate
  1. CALL FOR HELP
  2. Attempt ventilation with oral airway
  3. Consider/attempt LMA
  4. Emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy, or tracheostomy)
Oxygen Therapy

- in general, the goal of oxygen therapy is to maintain arterial oxygen saturation (SaO₂) > at a minimum, 90%
- small decrease in saturation below SaO₂ of 90% corresponds to a large drop in arterial partial pressure of oxygen (PaO₂)
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements (FiO₂) and the degree to which precise control of delivery is needed
- cyanosis can be detected at SaO₂ <85%, frank cyanosis at SaO₂ = 67%

Low Flow Systems

- provide O₂ at flows between 0-10 L/min
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25, consistent ventilation pattern
- dilution of oxygen with room air results in a decrease in FiO₂
- an increase in minute ventilation (tidal volume × RR) results in a decrease in FiO₂
- e.g. nasopharynx (prongs)
  - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
  - nasopharynx acts as an anatomic reservoir that collects O₂
  - delivered oxygen concentration (FiO₂) can be estimated by adding 4% for every additional litre of O₂ delivered
  - provides FiO₂ of 24-44% at O₂ flow rates of 1-6 L/min

Reservoir Systems

- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask
  - covers patient’s nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore O₂ tubing at a rate of at least 6 L/min to ensure that exhaled CO₂ is flushed through the exhalation ports and not rebreathed
  - provides FiO₂ of 55% at O₂ flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
  - during the exhalation phase, the bag accumulates with oxygen
  - provides FiO₂ of 80% at O₂ flow rates of 10-15 L/min

High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient’s inspiratory flow requirement
- deliver consistent and predictable concentration of O₂
- Venturi mask
  - delivers specific FiO₂ by varying the size of air entrapment
  - oxygen concentration determined by mask’s port and NOT the wall flow rate
  - enables control of gas humidity
  - FiO₂ ranges from 24-50%

Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

Mechanical Ventilation

- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver positive end expiratory pressure (PEEP)
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - tracheal stenosis, laryngeal edema
    - alveolar complications
    - ventilator-induced lung injury (barotrauma, volutrauma, atelectrauma), ventilator-associated pneumonia (nosocomial pneumonia), inflammation, auto-PEEP, patient-ventilator asynchrony
  - cardiovascular complications
    - reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension
neuromuscular complications
• muscle atrophy
• increased intracranial pressure
• metabolic
• decreased CO₂ due to hyperventilation
• alkalemia with over correction of chronic hypercarbia

Ventilator Strategies
• mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
• hypoxic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
• hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

Modes of Ventilation
• assist-control ventilation (ACV) or volume control (VC)
• every breath is delivered with a pre-set tidal volume and rate or minute ventilation
• extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
• pressure control ventilation (PCV)
• a minimum frequency is set and patient may trigger additional breaths above the ventilator
• all breaths delivered at a preset constant inspiratory pressure
• synchronous intermittent mandatory ventilation (SIMV)
• ventilator provides controlled breaths (either at a set volume or pressure depending on whether in VC or PCV, respectively)
• patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
• pressure support ventilation (PSV)
• patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
• useful for weaning off ventilator
• high-frequency oscillatory ventilation (HFOV)
• high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
• used commonly in neonatal and pediatric respiratory failure
• occasionally used in adults when conventional mechanical ventilation is failing
• non-invasive positive pressure ventilation (NPPV)
• achieved without intubation by using a nasal or face mask
• BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration (i.e. PEEP)
• CPAP: delivers constant pressure on both inspiration and expiration

Conclusions: Once-daily or multiple trials of spontaneous breathing led to extubation more quickly than intermittent mandatory or pressure-support ventilation.
Intraoperative Management

Temperature

Causes of Hypothermia (<36.0°C)
- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to
  - OR environment (cold room, IV fluids, instruments)
  - open wound
  - prevent with forced air warming blanket and warmed IV fluids

Causes of Hyperthermia (>37.5-38.3°C)
- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see Uncommon Complications, A28)
- over-zealous warming efforts

Heart Rate

Cardiac Arrest
- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclusion of all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
- when a patient sustains a cardiac arrest during anesthesia, it is important to remember that there are other causes on top the Hs and Ts to consider (i.e. local anesthetic systemic toxicity (LAST), excessive anesthetic dosing and others)
- for management of cardiac arrest, see ACLS Guidelines (Figure 16), A31

Intraoperative Tachycardia
- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
  - SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
  - wide complex tachycardia: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia
  - febrile illness/sepsis
  - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium) and withdrawal
  - Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see ACLS Guidelines (Figure 17), A32

Intraoperative Bradycardia
- bradycardia = HR <50 bpm; most concerning are 2nd degree (Mobitz type II) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see Cardiology and Cardiac Surgery, C16)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. Sch, opioids, edrophonium, neostigmine, halothane, digoxin, β-blockers)
  - high spinal/epidural anesthesia
- for management of bradycardia, see ACLS Guidelines (Figure 18), A32
Blood Pressure

Causes of Intraoperative Hypotension/Shock
- shock: condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of oxygen to tissues
  a) hypovolemic/hemorrhagic shock
    - most common form of shock, due to decrease in intravascular volume
  b) obstructive shock
    - obstruction of blood into or out of the heart
    - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
    - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism (and other emboli – i.e. fat, air)
  c) cardiogenic shock
    - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
    - e.g. myocardial dysfunction, dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
  d) septic shock
    - see Infectious Diseases, ID21
  e) spinal/neurogenic shock
    - decreased sympathetic tone
  f) anaphylactic shock
    - see Emergency Medicine, ER38
  g) drugs
    - vasodilators, high spinal anesthetic interfering with sympathetic outflow
  h) other
    - transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
    - see Hematology, H52 and Endocrinology, E33

Causes of Intraoperative Hypertension
- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phencyclidine, ketamine) and withdrawal
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome (see Psychiatry, PS44), thyroid storm, pheochromocytoma (see Endocrinology, E25)

Fluid Balance and Resuscitation
- total requirement = maintenance + deficit + ongoing loss
- in surgical settings this formula must take into account multiple factors including pre-operative fasting/descreased fluid intake, increased losses during or before surgery, fluid shifting during surgery, fluids given with blood products and medications

What is the Maintenance?
- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
- 4:2:1 rule to calculate maintenance requirements (applies to crystalloids only)
  - 4 mL/kg/h first 10 kg
  - 2 mL/kg/h second 10 kg
  - 1 mL/kg/h for remaining weight >20 kg
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - Na+: 3 mEq/kg/d
  - K+: 1 mEq/kg/d
- 50 kg patient maintenance requirements
  - fluid = 40 + 20 + 30 = 90 mL/h = 2160 mL/d = 2.16 L/d
  - Na+ = 150 mEq/d (therefore 150 mEq / 2.16 L/d = 69 mEq/L)
  - K+ = 50 mEq/d (therefore 50 mEq / 2.16 L/d = 23 mEq/L)
- above patient’s requirements roughly met with 2/3 D5W, 1/3 NS
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre
What is the Deficit?
• patients should be adequately hydrated prior to anesthesia
• total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
• total Na⁺ content determines ECF volume; [Na⁺] determines ICF volume
• hypovolemia due to volume contraction
  • extra-renal Na⁺ loss
  • GI: vomiting, NG suction, drainage, fistulae, diarrhea
  • skin/respiratory: insensible losses (fever), sweating, burns
  • vascular: hemorrhage
• renal Na⁺ and H₂O loss
  • diuretics
  • osmotic diuresis
  • hypoaldosteronism
  • salt-wasting nephropathies
• renal H₂O loss
  • diabetes insipidus (central or nephrogenic)
• hypovolemia with normal or expanded ECF volume
  • decreased CO
  • redistribution
    – hypoalbuminemia: cirrhosis, nephrotic syndrome
    – capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
• replace water and electrolytes as determined by patient's needs
• with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

What are the Ongoing Losses?
• losses from Foley catheter, NG, surgical drains
• third-spacing (other than ECF, ICF)
  • pleura, GI, retroperitoneal, peritoneal
  • evaporation via exposed viscera, burns
• blood loss
• ongoing loss due to surgical exposure and evaporative losses

</tbody>
</table>

IV Fluids
• replacement fluids include crystalloid and colloid solutions
• IV fluids improve perfusion but NOT O₂ carrying capacity of blood

Initial Distribution of IV Fluids
• H₂O follows ions/molecules to their respective compartments

Crystalloid Infusion
• salt-containing solutions that distribute only within ECF
• maintain euvolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
• if large volumes are to be given, use balanced fluids such as Ringer’s lactate or Plasmalyte”, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

Colloid Infusion (see Blood Products, A15)
• includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextran and starches e.g. hydroxyethyl starch [HES])
• distributes within intravascular volume
• 1:1 ratio (infusion:blood loss) only in terms of replacing intravascular volume
• HES colloids remain in intravascular space (metabolized by plasma serum amylase and renally excreted); two available in Canada: Voluven” and Pentaspan”
• the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
• colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill Patients
Cochrane DB Syst Rev 2012;6:CD000567
Purpose: To evaluate the effects of colloids compared to crystalloids for fluid resuscitation, specifically when used in critically ill patients.
Methods: A meta-analysis was performed looking at randomized controlled trials comparing colloid vs. crystalloid use in patients requiring volume replacement. Pregnant women and neonates were excluded. Primary outcome was overall mortality.
Results: Results were broken down based on specific colloid. For albumin (or plasma protein fraction) the relative risk (RR) was 1.01 (95% CI 0.93-1.09) as compared to crystalloid. For hydroxyethyl starch the RR was 1.10 (95% CI 0.91-1.32). Modified gelatin had a RR of 0.91 (95% CI 0.82-1.12) and Dextran had a RR of 1.24 (95% CI 0.84-1.65). For colloids mixed in a hypertonic crystalloid as compared to isotonic crystalloid the RR was 0.89 (95% CI 0.71-1.16).
Conclusions: There is no evidence that use of colloids improves survival in trauma patients, burn patients, or post-operative patients when compared to crystalloid solutions. Given the increased cost of colloids as compared to crystalloids, it is recommended that crystalloids be the fluid of choice in these patients.

Induction

Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia, however a RSI is indicated in patients at risk of regurgitation/aspiration (see Aspiration, A5)
- RSI uses pre-determined doses of induction drugs given in rapid succession to minimize the time patient is at risk for aspiration (i.e. from the time when they are asleep without an ETT until the time when the ETT is in and the cuff inflated)

Table 7. Comparison of Routine Induction vs. RSI

<table>
<thead>
<tr>
<th>Steps</th>
<th>Routine Induction</th>

<td>Intubate once paralyzed (1-45 s after SCh given), inflate cuff, confirm ETT position; cricoid pressure maintained until ETT cuff inflated and placement confirmed</td>
</tr>
</tbody>
</table>

Calculating Acceptable Blood Losses (ABL)

- Blood volume
  - term infant 80 mL/kg
  - adult male 70 mL/kg
  - adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
  - EBV = 70 kg × 70 mL/kg = 4900 mL
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion, (e.g. 70 g/L, for a person with Hb(i) = 150 g/L)
  - Hb(i) = 70 g/L
  - Calculate
    - ABL = Hb(i) – Hb(f) × EBV
      - Hb(f) = 150 – 70 × 4900
      - 150
      - 2613 mL
- Therefore in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

Transfusion Infection Risks

| Virus                  | Risk per 1 unit pRBCs |
|                       |                       |
| HIV                   | 1 in 21 million       |
| Hepatitis C virus     | 1 in 13 million       |
| Hepatitis B virus     | 1 in 7.5 million      |
| HTLV                  | 1 in 1-3 million      |
| Symptomatic Bacterial Sepsis | 1 in 40,000 from platelets and 1 in 250,000 from RBC |
| West Nile virus       | No cases since 2003    |

Induction Agents

- Induction in general anesthesia may be achieved with intravenous agents, volatile inhalation agents, or both

Intravenous Agents

- see Table 8
- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with minimal adverse effects
  - examples include propofol, sodium thiopental (not available in North America), or ketamine
  - a continuous propofol infusion may also be used for the maintenance phase of GA

Table 8. Intravenous Induction Agents

*N Properties and Adverse Effects of N₂O
Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only

Second Gas Effect
Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ETT cuff will markedly enlarge if N₂O is administered

Diffusion hypoxia: during anesthesia, the washout of N₂O from body stores into alveoli can dilute the alveolar O₂, creating a hypoxic mixture if the original O₂ is low

**Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)

MAC (Minimum Alveolar Concentration)
- the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- potency of inhalational agents is compared using MAC
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- MAC values are roughly additive when mixing N₂O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N₂O = 1 MAC of potent agent)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, generally 0.3-0.4 of the usual MAC

Muscle Relaxants and Reversing Agents

![Figure 8. Review of anatomy and physiology of the neuromuscular junction (NMJ)](image)

© Julie Man 2012
**Muscle Relaxants**

- two types of muscle relaxants
  1. depolarizing muscle relaxants: succinylcholine (SCh)
  2. non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cisatracurium, pancuronium

- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects
  1. facilitates intubation
  2. assists with mechanical ventilation
  3. prevents muscle stretch reflex and decreases muscle tone
  4. allows access to the surgical field (intraoperative surgery)

- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade
- see Tables 10 and 11, for more details including mechanism of action

---

**Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)**

<table>
<thead>
<tr>
<th>Mechanism of Action</th>
<th>Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intubating Dose (mg/kg)</td>
<td>1-1.5</td>
</tr>
<tr>
<td>Onset</td>
<td>30-60 s – rapid (fastest of all muscle relaxants)</td>
</tr>
<tr>
<td>Duration</td>
<td>3-5 min – short (no reversing agent for SCh)</td>
</tr>
<tr>
<td>Metabolism</td>
<td>SCh is hydrolyzed by plasma cholinesterase (pseudocholinesterase), found only in plasma and not at the NMJ</td>
</tr>
</tbody>
</table>
| Indications         | Assist intubation
  
  Increased risk of aspiration (need rapid paralysis and airway control (e.g. full stomach), hiatus herna, obesity, pregnancy, trauma)

  Short procedures

  Electrocortical therapy (ECT)

  Laryngospasm

| Side Effects | 1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors; may cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children)
  
  2. Hyperkalemia

  Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors

  Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells

  Patients at risk

  3rd degree burns 24 h-6 mo after injury

  Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy)

  Severe intra-abdominal infections

  Severe closed head injury

  Upper motor neuron lesions

  3. Can trigger MH (see Malignant Hyperthermia, A28)

  4. Increased ICP/intracavitary pressure/intragastric pressure (no increased risk of aspiration if competent lower esophageal sphincter)

  5. Fasciculations, post-operative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration |

| Contraindications |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Absolute          | Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenital), high risk for hyperkalemic response |
| Relative          | Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury |

### Reversing Agents
- neostigmine, pyridostigmine, edrophonium
- reversal agents are acetylcholinesterase inhibitors
  - inhibits enzymatic degradation of ACh; increases amount of ACh at nicotinic and muscarinic receptors, displacing non-depolarizing muscle relaxant
  - administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
  - can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation and increased bowel peristalsis)

### Table 12. Reversal Agents for Non-Depolarizing Relaxants

### Analgesia
- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDS, acetaminophen, ketamine, gabapentin, local, and regional anesthetic (see Table 15, A25)

### Maintenance
- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids) and muscle relaxants are also given as needed
Extubation

- criteria: patient must no longer have intubation requirements (see Table 2, A8)
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O₂ for 3-5 min
  - suction secretions from pharynx, deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O₂ delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

Complications of Extubation

- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

Laryngospasm
- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extube while patient is still deeply under anesthesia or fully awake
- treatment: apply sustained positive pressure with bag-mask ventilation with 100% oxygen, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (approximately 0.25 mg/kg) and reintubation if hypoxia develops

Regional Anesthesia

- local anesthetic (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

Patient Preparation
- sedation may be indicated before block
- monitoring should be as extensive as for general anesthesia

Benefits of Regional Anesthesia
- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Reduced perioperative blood loss
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE
- Shorter recovery and improved rehabilitation
- Pain blockade with preserved motor function

Epidural and Spinal Anesthesia

- most useful for surgeries performed below level of umbilicus

Anatomy of Spinal/Epidural Area
- spinal cord extends to L2, dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated (outside to inside)
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

Landmarking Epidural/Spinal Anesthesia
- Spinous processes should be maximally flexed
- L4 spinous processes found between iliac crests
- Common sites of insertion are L3-L4 and L4-L5

Classic Presentation of Dural Puncture
- Headache
  - Onset 6 h-3 d after dural puncture
  - Postural component (worse when sitting)
  - Occipital or frontal localization
  - ± tinnitus, diplopia
### Table 13. Epidural vs. Spinal Anesthesia

<table>
<thead>
<tr>
<th></th>
<th>Epidural</th>
<th>Spinal</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Deposition Site</strong></td>
<td>LA injected in epidural space (space between ligamentum flavum and dura)</td>
<td>LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots</td>
</tr>
<tr>
<td><strong>Onset</strong></td>
<td>Significant blockade requires 10-15 min</td>
<td>Rapid blockade (onset in 2-5 min)</td>
</tr>
<tr>
<td><strong>Effectiveness</strong></td>
<td>Effectiveness of blockade can be variable</td>
<td>Very effective blockade</td>
</tr>
<tr>
<td><strong>Difficulty</strong></td>
<td>Technically more difficult; greater failure rate</td>
<td>Easier to perform due to visual confirmation of CSF flow</td>
</tr>
<tr>
<td><strong>Patient Positioning</strong></td>
<td>Position of patient not as important; specific gravity not an issue</td>
<td>Hyperbaric LA solution – position of patient important</td>
</tr>
<tr>
<td><strong>Specific Gravity/Spread</strong></td>
<td>Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread</td>
<td>LA solution may be made hyperbaric (of greater specific gravity than the cerebrospinal fluid by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)</td>
</tr>
<tr>
<td><strong>Dosage</strong></td>
<td>Larger volume/dose of LA (usually &gt; toxic IV dose)</td>
<td>Smaller dose of LA required (usually &lt; toxic IV dose)</td>
</tr>
<tr>
<td><strong>Continuous Infusion</strong></td>
<td>Use of catheter allows for continuous infusion or repeat injections</td>
<td>None</td>
</tr>
<tr>
<td><strong>Complications</strong></td>
<td>Failure of technique, Hypotension, Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. “high spinal”, Epidural or subarachnoid hematoma, Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications), Systemic toxicity of LA (accidental intravenous), Catheter complications (shearing, kinking, vascular or subarachnoid placement), Infection, Dural puncture</td>
<td>Failure of technique, Hypotension, Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. “high spinal”, Epidural or subarachnoid hematoma, Post-spinal headache (CSF leak), Transient paresthesias, Spinal cord trauma, infection</td>

### Contraindications to Spinal/Epidural Anesthesia

- **absolute contraindications**
  - lack of resuscitative drugs/equipment
  - patient refusal
  - allergy to local anesthetic
  - infection at puncture site or underlying tissues
  - coagulopathies/bleeding diathesis
  - raised ICP
  - sepsis/bacteremia
  - severe hypovolemia
  - cardiac lesion with fixed output states (severe mitral/aortic stenosis)
  - lack of IV access
- **relative contraindications**
  - pre-existing neurological disease (demyelinating lesions)
  - previous spinal surgery, severe spinal deformity
  - prolonged surgery
  - major blood loss or maneuvers that can compromise reaction
Peripheral Nerve Blocks
- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- most major nerves or nerve plexi can be targeted (brachial plexus block, femoral nerve block, sciatic nerve block, etc.)
- performed with standard monitors
- approximately 2-4 per 10,000 risk of late neurologic injury
- resuscitation equipment must be available

Contraindications to Peripheral Nerve Blockade
- absolute contraindications
  - allergy to LA
  - patient refusal
- relative contraindications
  - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - local infection at block site
  - bleeding disorder

Local Anesthesia
Local Anesthetic Agents
- see Table 14, for list of LA agents

Definition and Mode of Action
- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the Na⁺ channel, inhibiting Na⁺ flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

Absorption, Distribution, Metabolism
- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

Selection of LA
- choice of LA depends on
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
  - potential for toxicity

</tbody>
</table>
**Systemic Toxicity**

- see Table 16, A25 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption

**CNS Effects**
- CNS effects first appear to be excitatory due to initial block of inhibitory fibres, then subsequent block of excitatory fibres
- effects in order of appearance
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus
  - visual disturbances
  - muscle twitching, tremors
  - unconsciousness
  - convulsions, seizures
  - generalized CNS depression, coma, respiratory arrest

**CVS Effects**
- vasodilation, hypotension
- decreased myocardial contractility
- dose-dependent delay in cardiac impulse transmission
  - prolonged PR, QRS intervals
  - sinus bradycardia
- CVS collapse

**Treatment of Systemic Toxicity**
- early recognition of signs, get help
- 100% O₂, manage ABCs
- diazepam or sodium thiopental may be used to increase seizure threshold
- manage arrhythmias (see ACLS Guidelines, A31-32)
- Intralipid ²⁰% to bind local anesthetic in circulation

**Local Infiltration and Hematoma Blocks**

**Local Infiltration**
- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000-1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

**Fracture Hematoma Block**
- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

**Topical Anesthetics**
- various preparations of local anesthetics available for topical use, may be a mixture of agents (EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

**Post-Operative Care**
- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home

**Common Post-Operative Anesthetic Complications**

**Nausea and Vomiting**
- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravolᵀᴹ), metoclopramide (Maxeranᵀᴹ; not with bowel obstruction), prochlorperazine (Stemetilᵀᴹ), ondansetron (Zofranᵀᴹ), granisetron (Kytrilᵀᴹ)
Confusion and Agitation
• ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
• neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
• pain, distended bowel/bladder
• fear/anxiety/separation from caregivers, language barriers
• metabolic disturbance (hypoglycemia, hypercalcaemia, hyponatremia – especially post-TURP)
• intracranial cause (stroke, raised intracranial pressure)
• drug effect (ketamine, anticholinergics, serotonin)
• elderly patients are more susceptible to post-operative delirium

Respiratory Complications
• susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
• airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypercapnea, and hypoxemia
• airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

Hypotension
• must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
• reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation (residual anesthetic agent)
• first step in treatment is usually the administration of fluids ± inotropic agents

Hypertension
• pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
• sodium nitroprusside or β-blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

Pain Management

Definitions
• pain: perception of noiception, which occurs in the brain
• noiception: detection, transduction, and transmission of noxious stimuli

Pain Classifications
• temporal: acute vs. chronic
• mechanism: noiceptive vs. neuropathic

Acute Pain
• pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
• usually limited to the area of damage/trauma and resolves with healing
Pharmacological Management of Acute Pain
- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity
- pharmacological treatment guided by WHO analgesia ladder
- patient controlled analgesia (PCA)
  - involves the use of computerized pumps that can deliver a constant infusion and bolus breakthrough doses of parenterally-administered opioid analgesics
  - limited by lockout intervals
  - most commonly used agents: morphine and hydromorphone
  - see Table 17, A26 for suggested infusion rate, PCA dose and lockout intervals

Opioid Antagonists (naloxone, naltrexone)
- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly µ receptors
  - naloxone is short-acting (t_{1/2} = 1 h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - naltrexone is longer-acting (t_{1/2} = 10 h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, hypertension, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

Neuropathic Pain
- see Neurology, N41

Chronic Pain
- chronic pain: greater than 3 mo, or recurrent pain that occurs at least 3 times throughout three month period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia and non-pharmacological techniques

Obstetrical Anesthesia

Anesthesia Considerations in Pregnancy
- airway
  - possible difficult airway as tissues becomes edematous and friable especially in labour
- respiratory
  - decreased FRC and increased O₂ consumption cause more rapid desaturation during apnea
- cardiovascular system
  - increased blood volume > increased RBC mass results in mild anemia
  - decreased SVR proportionately greater than increased CO results in decreased BP
- prone to decreased BP due to aorticaval compression – therefore for surgery, a pregnant patient is positioned in left uterine displacement using a wedge under her right flank
- central nervous system
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- gastrointestinal system
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
- combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

Options for Analgesia during Labour
- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object
- systemic medication
  - easy to administer, but risk of maternal or neonatal respiratory depression
  - opioids most commonly used if delivery is not expected within 4 h
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

Nociceptive Pathways in Labour and Delivery

Labour
- Convoluntary dilatation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1

Delivery
- Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4
Options for Caesarean Section
- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade

Pediatric Anesthesia

Respiratory System
- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U shaped and angled at 45º; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include
  - faster RR, immature respiratory centres which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
  - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

Cardiovascular System
- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia severe compromise in CO

Temperature Regulation
- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant’s head, humidification of inspired gases, and warming of infused solutions

Central Nervous System
- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetics mature at 4-6 mo thus autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

Glucose Maintenance
- infants less than 1 yr old can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

Pharmacology
- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB
- muscle relaxants
  - non-depolarizing
    - immature NMJ, variable response
  - depolarizing
    - must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm and malignant hyperthermia
Uncommon Complications

Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular Ca\(^{2+}\) (because of an anomaly of the ryanodine receptor which regulates Ca\(^{2+}\) channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100,000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

Clinical Picture

- onset: immediate or hours after contact with trigger agent
  - increased oxygen consumption
  - increased $ET_{CO_2}$ on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - hypertension
  - increased temperature (late sign)
- muscular symptoms
  - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and $ET_{CO_2}$ monitoring

Malignant Hyperthermia Management (Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008)

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
   - repeat until there is control of signs of MH; up to 30 mg/kg as necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature >39°C
   - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
   - stop cooling if temperature is <36°C to prevent drift to <36°C
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
   - use standard drug therapy except Ca\(^{2+}\) channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene
6. hyperkalemia
   - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
   - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow $ET_{CO_2}$, electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/color with Foley catheter, coagulation studies
   - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce diuresis to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

Signs of Malignant Hyperthermia

- Unexplained rise in $ET_{CO_2}$
- Increase in minute ventilation
- Tachycardia
- Rigidity
- Hyperthermia (late sign)

Basic Principles of MH Management

“Some Hot Dude Better Get Iced Fluids Fast”

- Stop all triggering agents, give 100% O\(_2\)
- Hyperventilate
- Dantrolene 2.5 mg/kg every 5 min
- Bicarbonate
- Glucose and insulin
- IV fluids; cool patient to 38°C
- Fluid output; consider furosemide
- Tachycardia: be prepared to treat VT
**Abnormal Pseudocholinesterase**

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors rebound neuromuscular blockade once drug effect is terminated)

**Appendices**

**Difficult Tracheal Intubation in Unconscious Patient**

---

**Figure 14. Difficult tracheal intubation encountered in the unconscious patient**

*SGD = supraglottic device*

Difficult Tracheal Intubation

Airway exam or history predicts **difficult tracheal intubation**

If general anesthesia is induced . . .

1. Is tracheal intubation predicted to success in no more than 3 attempts?
2. If tracheal intubation fails, will face mask or SGD ventilation succeed?

. . . and are other patient and contextual issues favourable?

1. Rapid oxygen desaturation unlikely with onset of apnea?
2. Little risk of aspiration once unconscious?
3. No obstructing airway pathology?
4. Additional skilled help available?
5. Clinician skilled in planned technique(s) and equipment available?

Low risk of failed oxygenation if induced

Consider intubation after induction of general anesthesia

• e.g. IV induction (e.g. RSI)
• e.g. inhalational induction

Significant risk of failed oxygenation if induced

Is awake intubation feasible?

• Patient can cooperate
• Situation acuity permits

Consider awake intubation/techniques

• e.g. awake oral/nasal
• e.g. awake tracheotomy

Other options

• e.g. induction with "double set-up" preparation for immediate cricothyrotomy or tracheotomy

---

Figure 15. Anticipated difficult tracheal intubation

IV = intravenous; RSI = rapid sequence induction/intubation; SGD = supraglottic device

Figure 16. Adult cardiac arrest algorithm
Adult Bradycardia
(With Pulse)

1. Assess appropriateness for clinical condition
   Heart rate typically <50/min if bradyarrhythmia

2. Identify and treat underlying cause
   • Maintain patent airway; assist breathing as necessary
   • Oxygen (if hypoxemic)
   • Cardiac monitor to identify rhythm; monitor blood pressure and oximetry
   • IV access
   • 12-Lead ECG if available; do not delay therapy

3. Persistent bradyarrhythmia causing:
   • Hypotension?
   • Acutely altered mental status?
   • Signs of shock?
   • Ischemic chest discomfort?
   • Acute heart failure?

4. Monitor and observe

5. Yes
   Atropine
   If atropine ineffective:
   • Transcutaneous pacing
     OR
   • Dopamine infusion
     OR
   • Epinephrine infusion

6. Consider:
   • Expert consultation
   • Transvenous pacing

Doses/Details
Atropine IV Dose:
First dose: 0.5 mg bolus
Repeat every 3-5 min
Maximum: 3 mg

Dopamine IV Infusion:
2-10 mcg/kg per min

Epinephrine IV Infusion:
2-10 mcg per min

Figure 17. Adult tachycardia algorithm
**Adult Tachycardia**

(With Pulse)

1. Assess appropriateness for clinical condition
   - Heart rate typically ≥150/min if tachyarrhythmia

2. Identify and treat underlying cause
   - Maintain patent airway; assist breathing as necessary
   - Oxygen (if hypoxic)
   - Cardiac monitor to identify rhythm; monitor blood pressure and oximetry

3. Persistent tachyarrhythmia causing:
   - Hypotension?
   - Acutely altered mental status?
   - Signs of shock?
   - Ischemic chest discomfort?
   - Acute heart failure?

4. Synchronized cardioversion
   - Consider sedation
   - If regular narrow complex, consider adenosine

5. Wide QRS? ≥0.12 second
   - Yes
   - IV access and 12-lead ECG if available
   - Consider adenosine only if regular and monomorphic
   - Consider antiarrhythmic infusion
   - Consider expert consultation
   - No

6. No

Doses/Details

**Synchronized Cardioversion**
- Initial recommended doses:
  - Narrow regular: 50-100 J
  - Narrow irregular: 120-200 J biphasic or 200 J monophasic
  - Wide regular: 100 J
  - Wide regular: defibrillation dose (NOT synchronized)

**Adenosine IV Dose**:
- First dose: 6 mg rapid IV push; follow with NS flush
- Second dose: 12 mg if required

**Antiarrhythmic Infusions for Stable Wide-QRS Tachycardia**

**Procainamide IV Dose**:
- 20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases >50%, or maximum dose 17 mg/kg given
- Maintenance infusion: 1-4 mg/min
- Avoid if prolonged QT or CHF

**Amiodarone IV Dose**:
- First dose: 150 mg over 10 min
- Repeat as needed if VT recurs
- Follow by maintenance infusion of 1 mg/min for 1st 6 h

**Sotalol IV Dose**:
- 100 mg (1.5 mg/kg) over 5 min
- Avoid if prolonged QT

---

*Toronto Notes 2017*  
*Cardiology C1*
Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)
Cardiac Anatomy

- layers of the heart
  - endocardium, myocardium, epicardium, visceral pericardium, pericardial cavity, parietal pericardium
- valves
  - semilunar valves:
    - aortic valve, 3 valve leaflets: separates LV and ascending aorta
    - pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
    - tricuspid valve, 3 valve leaflets: separates RA and RV
    - mitral/bicuspid valve, 2 valve leaflets: separates LA and LV
- conduction system
  - SA node governs pacemaking control
  - anterior-, middle-, and posterior-internodal nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
  - atrial impulses converge at the AV node
    - the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosis (except when accessory pathways are present)
  - the bundle of His bifurcates into left and right bundle branches (LBB and RBB)
  - LBB further splits into anterior and posterior fascicles
  - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

Legend:
- AV – aortic valve
- LA – left atrium
- LV – left ventricle
- MV – mitral valve

Features of Abnormal JVP Wave Formation
- Atrial fibrillation: absent a wave
- 3rd degree heart block: cannon a waves
- Tricuspid regurgitation: cv wave, elevated JVP
- Cardiac tamponade: x descent only, absent y descent
- Constrictive pericarditis: prominent y descent, Kussmaul's sign (paradoxical increase in JVP with inspiration)
• cardiovascular innervation
  ■ sympathetic nerves
    • innervate the SA node, AV node, ventricular myocardium and vasculature
    • SA node (β1 fibres increase pacemaking activity (chronotropy - HR)
    • cardiac muscle (β1 fibres increase contractility (inotropy - SV)
    • stimulation of β1- and β2-receptors in the skeletal and coronary circulation causes vasodilatation
  ■ parasympathetic nerves
    • innervate the SA node, AV node, atrial myocardium but few vascular beds
    • basal vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node
      resulting in slowing of pacemaker activity and conduction (i.e. reduced dromotropy – if only affecting AV node conduction)
    • parasympathetics have very little impact on total peripheral vascular resistance

---

**Differential Diagnoses of Common Presentations**

Note: **bold** text indicates most common, **underlined** text indicates life threatening condition

---

### Chest Pain

- cardiac
  - MI/angina, myocarditis, pericarditis/Dressler's syndrome
- pulmonary
  - PE, pneumothorax/hemothorax, tension pneumothorax, pneumonia, empyema, pulmonary neoplasm, bronchiectasis, TB
- gastrointestinal
  - esophageal: GERD, esophageal rupture, spasm, esophagitis, ulceration, achalasia, neoplasm, Mallory-Weiss syndrome
  - other structures: PUD, gastritis, pancreatitis, biliary colic
- mediastinal
  - lymphoma, thymoma
- vascular
  - dissecting aortic aneurysm, aortic rupture
- surface structures
- costochondritis
- rib fracture
- skin (bruising, herpes zoster)
- breast
- anxiety/psychosomatic

### Loss of Consciousness

- hypovolemia
- vasovagal
- cardiac
  - structural or obstructive causes
    - ACS, AS, HCM, cardiac tamponade, constrictive pericarditis
  - arrhythmias (*see Arrhythmias, C16*)
- respiratory
  - massive pulmonary embolism, pulmonary hypertension, hypoxia, hypercapnia
- neurologic
  - stroke/TIA (esp. vertebrobasilar insufficiency), migraine, seizure
- metabolic
  - anemia, hypoglycemia
- drugs
  - antihypertensives, antiarrhythmics, diuretics
- autonomic dysfunction
- diabetic neuropathy
- psychiatric
  - panic attack

### Local Edema

- inflammation/infection
- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis, venous insufficiency, chronic lymphangitis, lymphatic tumour infiltration, filariasis
Generalized Edema

- increased hydrostatic pressure/fluid overload
  - heart failure, pregnancy, drugs (e.g. CCBs), iatrogenic (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - liver cirrhosis, nephrotic syndrome, malnutrition
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism, exogenous steroids, pregnancy, estrogens

Palpitations

- cardiac
  - arrhythmias (PAC, PVC, SVT, VT), valvular heart disease, HCM
- endocrine
  - thyrotoxicosis, pheochromocytoma, hypoglycemia
- systemic
  - anemia, fever
- drugs
  - stimulants and anticholinergics
- psychiatric
  - panic attack

Dyspnea

- cardiovascular
  - acute MI, CHF/LV failure, aortic/mitral stenosis, aortic/mitral regurgitation, arrhythmia, cardiac tamponade, constrictive pericarditis, left-sided obstructive lesions (e.g. left atrial myxoma), elevated pulmonary venous pressure
- respiratory
  - airway disease
    - asthma, COPD exacerbation, upper airway obstruction (anaphylaxis, foreign body, mucus plugging)
  - parenchymal lung disease
    - ARDS, pneumonia, interstitial lung disease
  - pulmonary vascular disease
    - PE, pulmonary HTN, pulmonary vasculitis
  - pleural disease
    - pneumothorax, pleural effusion
- neuromuscular and chest wall disorders
  - C-spine injury
    - polymyositis, myasthenia gravis, Guillain-Barré syndrome, kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, hypercapnia

Cardiac Diagnostic Tests

Electrocardiography Basics

Description

- a graphical representation (time versus amplitude of electrical vector projection) of the electrical activity of the heart
- on the ECG graph
  - the horizontal axis represents time (at usual paper speed 25 mm/s)
    - 1 mm (1 small square) = 40 msec
    - 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting 10 mm/mV)
    - 1 mm (1 small square) = 0.1 mV
    - 10 mm (2 large squares) = 1 mV
- leads
  - standard 12-lead ECG
    - limb leads: I, II, III, aVL, aVR, aVF
    - precordial leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
  - additional leads
    - right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
  - lateral = I, aVL, V5, V6; inferior = II, III, aVF; anterior = V1-V4
Approach to ECGs

Indications
- detect myocardial injury, ischemia, and the presence of prior infarction
- palpitations, syncope, antiarrhythmic drug monitoring
- arrhythmia surveillance in patients with documented or potentially abnormal rhythms
- surveillance of non-sustained arrhythmias that can lead to prophylactic intervention

Contraindications
- no absolute contraindications except patient refusal or electrode latex adhesive allergy

Approach to ECGs

Introduction
Below, we are presenting both the Classical Approach and the newer PQRSTU Approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same. These two approaches should help you better understand the concepts of ECG interpretation and equip you with the necessary skills to interpret ECGs in exam scenarios and clinical practice.

Classical Approach to ECGs

RATE
- normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib)
- regular rhythm
  - to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 sec)
  - or remember 300-150-100-75-60-50-43 (rate falls in this sequence with the number of large squares between 2 QRS complexes)
- irregular rhythm
  - rate = 6 x number of R-R intervals in 10 s (the “rhythm strips” are 10 sec recordings)
  - atrial escape rhythm = 60-80 bpm; junctional escape rhythm = 40-60 bpm;
  - ventricular escape rhythm = 20-40 bpm

RHYTHM
- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals e.g. A. Flutter
- irregularly irregular: R-R intervals vary erratically e.g. A. Fib, V. Fib
- normal sinus rhythm (NSR)
  - P wave precedes each QRS; QRS follows each P wave
  - P wave axis is normal (positive in 2 out of the 3 following leads I, II, aVF)
  - rate between 60-100 bpm

AXIS
- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
- the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane – it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
  - normal axis: -30° to 90° (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis < -30°
  - right axis deviation (RAD): axis > 90°
- QRS axis in the horizontal plane is not routinely calculated
  - transition from negative to positive is usually in lead V3

Differential Diagnosis for Left Axis Deviation (LAD)
- Left anterior hemiblock
- Inferior MI
- WPW
- RV pacing
- Normal variant
- Elevated diaphragm
- Lead displacement
- Endocardial cushion defect

Differential Diagnosis for Right Axis Deviation (RAD)
- RVH
- Left posterior hemiblock
- Pulmonary embolism
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

</tbody>
</table>

**ISCHEMIA/INFARCTION**

- look for the anatomic distribution of the following ECG abnormalities (see Table 3, C8)
  - ischemia
    - ST segment depression
    - T wave inversion (most commonly in V1-V6)
  - injury/infarct
    - transmural (involving the epicardium)
    - ST elevation in the leads facing the area injured/infarcted
    - subendocardial
    - marked ST depression in the leads facing the affected area
    - may be accompanied by enzyme changes and other signs of MI

*Figure 10. Typical ECG changes with infarction*

- ST elevation: at least 1 mm in 2 adjacent limb leads or at least 1-2 mm in adjacent precordial leads in STEMI (signifies complete occlusion and transmural ischemic injury) vs. diffuse pattern in early pericarditis vs. transient ST elevation in patients with coronary artery spasm (e.g. Prinzmetal angina) which can be slight or prominent (>10 mm)
• “typical” sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
     • usually in the first hours post infarct
     • in acute posterior MI, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads, that are not recorded in the standard 12-lead ECG) - get a 15-lead ECG
  3. significant Q waves: >40 msec or >1/3 of the total QRS and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
     • Q waves of infarction may appear in the very early stages, with or without ST changes
     • non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
  4. inverted T waves (one day to weeks after infarction)
• completed infarction
  • abnormal Q waves (Q waves may be present in leads III and aVL in normal individuals due to initial septal depolarization)
  • duration >40 msec (>30 msec in aVF for inferior infarction)
  • Q/QRS voltage ratio is >33%
  • present in at least 2 consecutive leads in the same territory
  • abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and occasionally in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

Table 3. Areas of Infarction/Ischemia (right dominant anatomy)

</tbody>
</table>

**MISCELLANEOUS ECG CHANGES**

**Electrolyte Disturbances**

- **hyperkalemia**
  - mild to moderate (K⁺ >5-7 mmol/L): tall peaked T waves
  - severe (K⁺ >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show bizarre patterns, axis shifts left or right, ST shift with tall T waves, eventually becomes a “sine wave” pattern
- **hypokalemia**
  - ST segment depression, prolonged QT interval, low T waves, prominent U waves (U>T)
  - enhances the toxic effects of digitalis
- **hypercalcemia**
  - shortened QT interval (more extracellular Ca²⁺ means shorter plateau in cardiac action potential)
- **hypocalcemia**
  - prolonged QT interval (less extracellular Ca²⁺ means longer plateau in cardiac action potential)

**Hypothermia**

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: “hump-like” waves at the junction of the J point and the ST segment

**Pericarditis**

- early: diffuse ST segment elevation ± PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- ± tachycardia
**Drug Effects**

- **digitalis**
  - therapeutic levels may be associated with “digitalis effect”
  - ST downsloping or “scooping”
  - T wave depression or inversion
  - QT shortening ± U waves
  - slowing of ventricular rate in AFib
  - toxic levels associated with
  - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (*see Arrhythmias, C16*)
  - “regularization” of ventricular rate in AFib due to a junctional rhythm and AV dissociation
- amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, some antibiotics: prolonged QT interval, U waves

**Pulmonary Disorders**

- *cor pulmonale* (often secondary to COPD)
  - low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  - RAE and RVH with strain
  - multifocal atrial tachycardia (MAT)
- massive pulmonary embolism (PE)
  - sinus tachycardia and A. Fib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain
  - most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

### Alternative PQRSTU Approach to ECGs

Note: the information seen in this alternative approach – the PQRSTU Approach – is the same as the information in the Classical Approach; it is just organized in a different way based on the anatomy of the ECG
P WAVE
• the P wave represents atrial contraction; best leads: II, VI
  - lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
  - lead VI: the P wave is biphasic with a negative phase slightly greater than the positive phase
• atrial flutter: sawtooth P wave (Hint: flip the ECG upside-down to see it better if unclear)
• atrial fibrillation: absent P wave, may have fibrillatory wave, irregular rhythm
• right atrial enlargement: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
• left atrial enlargement: negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

P-R INTERVAL
• the P-R interval shows the delay between atrial and ventricular contraction that is mediated by the AV node; the magnitude of the delay is referred to as "dromotropy"
• positive dromotropy increases conduction velocity (e.g., epinephrine stimulation), negative dromotropy decreases velocity (e.g., vagal stimulation)
• P-R interval should be 120-200 msec
• long P-R interval (>200 msec)
  - heart block
    • first degree: fixed, prolonged P-R interval
    • second degree Mobitz I/Wenckebach: steadily prolonging P-R interval to eventual dropped beat
    • second degree Mobitz II/Hay: fixed P-R interval with ratio of beat to dropped beat (e.g., for every 3 beats, there is one dropped beat [3:1])
    • third degree/complete: variable P-R intervals, P-P and R-R intervals individually constant but not in sync
  - atrial flutter
  - sinus bradycardia (normal to have long P-R if heart rate slow)
  - hypokalemia
  - "trifascicular" block -1st degree AV block with LAHF and complete RBBB
• short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upswooping of the P-R segment into the QRS complex indicating pre-excitation)
  - accessory pathways
  - WPW
  - low atrial rhythm

QRS COMPLEX
• the QRS is where ventricular contraction is visualized
• rate: check the R-R interval to see if it matches the P-P interval
• amplitude: check for hypertrophy (see Table 2, C7)
• narrow width (<120 msec) QRS means that the His-Purkinje system is being used
• wide width (>120 msec) QRS means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, drugs (e.g., TCAs, antiarrhythmics)
• Q wave: the first downward deflection of the QRS complex
  - significant Q wave: >40 msec or >33% of total QRS amplitude; indicate myocardial necrosis (new or historical)
• R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

ST SEGMENT
• located between QRS complex and the beginning of T wave
• corresponds to the completion of ventricular depolarization
• normally at the same level as "baseline/TP segment"
• ST elevation: please see the infarct section above
• ST depression: ischemia
• ischemia which causes ST depression can result in myocardial damage (NSTEMI)
• lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart

T WAVE
• this is the repolarization phase of the ventricles (repolarization of the atria are obscured by the QRS complex)
• typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (esp. in V1 and V2)
• pathology when T wave variation occur in consecutive leads
  - inversion: BBB, ischemia, hypertrophy, drugs (e.g., digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)
  - elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - flattened: hypokalemia, pericarditis, drugs (e.g., digitalis), pericardial effusion
• variations: T wave alters; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
• appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e., T wave negative if ends with R or R'; positive if ends with S)
• inappropriate T wave concordance suggests ischemia or infarction

Significant ECG Changes
• Look for ST changes starting at 60 msec from J point
• J point = the junction between the QRS complex and the ST segment
• ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
• ST depression: downsloping or horizontal
• Q Wave: pathological if Q wave >1 small square (>40 msec) or >33% of the total QRS

Insignificant Q Wave
• Septal depolarization by the left bundle
• Seen in leads I, II, III, aVL, V5, V6
• <40 msec
Q-T INTERVAL
- this represents the duration of ventricular depolarization and repolarization and is often difficult to interpret
- corrected QT (QTc) is often used instead in practice to correct for the repolarization duration; QTc = QT / √RR
- normal QTc is 360-450 msec for males and 360-460 for females
  - increased (>450 msec for males and >460 for females); risk of Torsades de Pointes (a lethal tachyarrhythmia)
  - genetic Long QT Syndrome (often a channelopathy)
  - drugs: antibiotics, SSRIs, antipsychotics, antiarrhythmics
  - electrolytes: low Ca++, low Mg++, low K+
  - others: hypothyroidism, hyperthermia, cardiomyopathy
- decreased (<360 msec): risk of VFib
  - electrolytes: high Ca++, drugs: digoxin
  - others: hyperthermia

U WAVE
- origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions:
  - prominent (>25% of T wave): electrolyte (low K+), drugs (digoxin, antiarrhythmics)
  - inverted (from T wave): ischemia, volume overload

Cardiac Biomarkers
- provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

</tr>
<tr>
<td>Troponin T</td>
</tr>
<tr>
<td>CK-MB</td>
</tr>
</tbody>
</table>

- check troponin I at presentation and 8 h later ± creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
  - AST and LDH also increased in MI (low specificity)
  - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
  - DDxs of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN

Ambulatory ECG
- description
  - extended ambulatory ECG of 24 or 48 h or 14 or 30 d duration
  - provides a view of only two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena that are often transient and of brief duration
  - continuous loop: a small, lightweight, battery operated recorder that records two or three channels of electrocardiographic data
    - patient activated event markers
    - minimum of 24-48 h
  - implantable device: subcutaneous monitoring device for the detection of cardiac arrhythmias
    - typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - can be used for months to years
- indications
  - evaluation of cardiac rhythm abnormalities
  - has also been used for assessing pacemaker and implantable cardioverter-defibrillator function, evidence of myocardial ischemia, late potentials, and heart rate variability
- contraindications
  - no absolute contraindications
  - patient refusal
  - allergies (sensitivities to latex adhesive)
- risks: no absolute risks

Differential Diagnosis of ST Segment Changes
- ST Elevation I HELP A PAL
  - Ischemia with reciprocal changes
  - Hypotension (Osborne waves)
  - Early repolarization (normal variant, need old ECGs to confirm)
  - LBBB
  - Post-MI
- Acute STEMl
- Prinzmetal’s (Vasospastic) angina
- Acute pericarditis (diffuse changes)
- Left/right ventricular aneurysm

ST Depression WAR SHIP
- WPW syndrome
- Acute NSTEMI
- RBBI/BBB
- STEMl with reciprocal changes
- Hypertrophy (LVH or RVH) with strain
- Ischemia
- Post-MI

Use of B-Type Natriuretic Peptide in the Evaluation and Management of Acute Dyspnea (BASEL)
- NEJM 2004;350;647-54
- Study: Prospective, RCT.
- Population: 452 patients (mean age 71 yr 58% male) with acute dyspnea; patients with severe renal disease or cardiogenic shock were excluded.
- Intervention: Assessment including measurement of B-type natriuretic peptide or standard assessment.
- Outcome: Time to discharge and total cost of treatment.
- Results: Median time to discharge was significantly shorter in the intervention group when compared with the control group (8.0 vs. 11.0 d, p=0.001).
  - Total cost was also significantly lower in the intervention group ($5410 vs. $7264, p=0.006).
  - In addition, the measurement of B-type natriuretic peptide significantly reduced the need for admission to hospital and intensive care. The 30-d mortality rates were similar (10% vs. 12%, p=0.45).
- Conclusions: In patients with acute dyspnea, measurement of B-type natriuretic peptide improves clinical outcomes (need for hospitalization or intensive care) and reduces time to discharge and total cost of treatment.
Echocardiography

Transthoracic Echocardiography (TTE)

- **description:** ultrasound beams are directed across the chest wall to obtain images of the heart
- **indications**
  - evaluation of LVEF, wall motion abnormalities, myocardial ischemia and complications of MI
  - evaluation of chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion
  - evaluation of unexplained hypotension, murmurs, syncope, congenital heart disease

Transoesophageal Echocardiography (TEE)

- **description:** invasive procedure used to complement transthoracic echocardiography
  - ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
  - better visualization of posterior structures, including left atrium, mitral and aortic valves, inter-atrial septum
- **indications**
  - should be performed as the initial test in certain life-threatening situations, (e.g. aortic dissection) when other tests contraindicated (e.g. CT angiography in patient with renal failure)
  - intracardiac thrombi, tumours, valvular vegetations (infective endocarditis), aortic dissection, aortic atheromas, prosthetic valve function, shunt, technically inadequate transthoracic study
  - evaluation for left atrial/left atrial appendage thrombus in a patient with atrial fibrillation/atrial flutter to facilitate clinical decision making regarding electrical cardioversion or ablation
- **risks**
  - serious complications are extremely rare (<1 in 5,000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma

Stress Echocardiography (SE)

- **description:** echocardiography using either exercise (treadmill or bicycle) or pharmacologic agents (dobutamine) as the stress mechanism
- **indications**
  - useful alternative to other stress imaging modalities
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS when used to decide on potential efficacy of revascularization
  - to evaluate the clinical significance of valvular heart disease
  - evaluation of myocardial viability, dyspnea of possible cardiac origin, mitral valve disease, aortic stenosis, mitral regurgitation, pulmonary hypertension, patients with hypertrophic cardiomyopathy (for LVOT obstruction)
  - dobutamine
    - pharmacologic stress for patients who are physically unable to exercise; same indications as exercise stress echo
    - low dose dobutamine stress echo can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- **contraindications**
  - contraindications to exercise testing
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - AAA has been considered as a relative contraindication to exercise testing or dobutamine stress echocardiography

Contrast Echocardiography with Agitated Saline Contrast

- **description:** improves resolution and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - allows visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and intrapulmonary shunt

Contrast Echocardiography with Transpulmonary Contrast Agents

- **description:** newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction and wall motion abnormalities (in patients with technically inadequate echocardiograms), and intracardiac mass
- **risks**
  - risk of non-fatal MI and death are rare
  - ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis
Stress Testing

**EXERCISE TESTING**
- **description**: cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- **indications**
  - patients with intermediate (10-90%) pretest probability of CAD based on age, gender, and symptoms
  - ST depression <1 mm at rest, no left bundle branch block, no digoxin or estrogen use
- **exercise test results stratify patients into risk groups**
  1. low risk patients can be treated medically without invasive testing
  2. intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
  3. high risk patients should be referred for cardiac catheterization
- **contraindications**
  - acute myocardial infarction (within two days)
  - unstable angina pectoris
  - uncontrolled arrhythmias causing symptoms of hemodynamic compromise
  - symptomatic severe valvular stenosis
  - uncontrolled symptomatic heart failure
  - active endocarditis or acute myocarditis or pericarditis
  - acute aortic dissection
  - acute pulmonary or systemic embolism
  - acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
  - termination of exercise testing
    - patient's desire to stop
    - drop in systolic blood pressure of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
    - moderate to severe angina
    - ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
    - increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
    - signs of poor perfusion (cyanosis or pallor)
    - technical difficulties in monitoring ECG or systolic blood pressure
    - sustained ventricular tachycardia
- **risks**: death, myocardial infarction, arrhythmia, hemodynamic instability, and orthopedic injury (<1-5/10,000 supervised tests)

**NUCLEAR CARDIOLOGY**
- **description**
  - myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
  - evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
  - predicts the likelihood of further cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
  - often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
  - stress with either treadmill or IV vasodilator stress (dipyridamole, adenosine, regadenoson)
  - images of the heart obtained during stress and at rest 3-4 h later
  - tracers
    - Thallium-201 (201Tl, a K+ analogue)
    - Technetium-99 (99Tc)-labeled tracer (sestamibi/Cardiolite® or hexamibi/Myoview®)
- **indications**
  - exercise MPI
    - when ECG cannot be interpreted appropriately
    - intermediate pre-test probability with normal/equivocal exercise ECG
    - in patients with previous imaging whose symptoms have changed
    - to diagnose ischemia
    - dipyridamole/adenosine MPI
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarkers
  - when ECG is cannot be interpreted appropriately due to LBBB or V-paced rhythm among patients unable to exercise, with the same indications as exercise MPI
- **contraindications**
  - contraindications to exercise testing
    - vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
    - pregnancy
  - **risks**: radiation exposure

**STRESS ECHOCARDIOGRAPHY**
- see Echocardiography, C12
Cardiac Catheterization and Angiography

Right Heart Catheterization (Swan-Ganz Catheter)

- **Description:** Also known as pulmonary artery catheterization
  - Obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
  - Can estimate cardiac output, systemic and pulmonary vascular resistance as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
  - Right atrial, right ventricular, and pulmonary artery pressures are recorded
  - Can also be used to measure the Cardiac Index (CI)
    - \( \text{CI} = \frac{\text{CO}}{\text{body surface area}} \)
    - Cardiac index is a measure of cardiac function
    - \(< 1.8 \text{ L/min/m}^2 \) usually means cardiogenic shock
    - \(2.6-4.2 \text{ L/min/m}^2\) is considered normal
  - Pulmonary capillary wedge pressure (PCWP)
    - Obtained by advancing the catheter to wedge in the distal pulmonary artery
    - Records pressure measured from the pulmonary venous system
    - In the absence of pulmonary venous disease reflects left atrial pressure

- **Indications**
  - Unexplained or unknown volume status in shock
  - Severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
  - Suspected or known pulmonary artery hypertension
  - Severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt, severe valvular disease, pulmonary hypertension) and undergoing corrective or other surgery

- **Contraindications**
  - Lack of consent
  - Infection at the insertion site
  - The presence of a right ventricular assist device
  - Insertion during cardiopulmonary bypass

- **Risks**
  - Complications for diagnostic catheterization <1%
  - Inadequate diagnostic procedures occur in <1% of cases
  - Complications of insertion: atrial and/or ventricular arrhythmias (~3% of patients)
  - Catheter misplacement or knotting (uncommon)
  - Perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
  - Complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
  - Within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

![Figure 17. Swan-Ganz catheter placement](image-url)
Left Heart Catheterization

- description
  - accomplished by introducing a catheter into the brachial or femoral artery and advancing it through the aorta, across the aortic valve, and into the left ventricle
  - evaluates mitral and aortic valvular defects and myocardial disease
  - systolic and end-diastolic pressure tracings recorded
  - LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
  - cardiac output (measured by the Fick oxygen method or the indicator dilution method)

- indications
  - identification of the extent and severity of CAD and evaluation of left ventricular function
  - assessment of the severity of valvular or myocardial disorders (e.g. aortic stenosis or insufficiency, mitral stenosis or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
  - collection of data to confirm and complement noninvasive studies
  - determination of the presence of CAD in patients with confusing clinical presentations or chest pain of uncertain origin

- contraindications
  - severe uncontrolled hypertension
  - ventricular arhythmias
  - acute stroke
  - severe anemia
  - active gastrointestinal bleeding
  - allergy to radiographic contrast
  - acute renal failure
  - uncontrolled congestive failure (so that the patient cannot lie flat)
  - unexplained febrile illness or untreated active infection
  - electrolyte abnormalities (e.g. hypokalemia)
  - severe coagulopathy

- risks
  - complications for diagnostic catheterization <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

Coronary Angiography

- description
  - radiographic visualization of the coronary vessels after injection of radiopaque contrast media
  - coronary vasculature accessed via the coronary ostia

- indications
  - to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
  - to determine the presence and extent of obstructive CAD
  - to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
  - can also be used when the diagnosis of CAD is uncertain and CAD cannot be reasonably excluded by noninvasive techniques

- contraindications: severe renal failure (due to contrast agent toxicity – must check patient’s renal status)

- risks: major complications <2%, but increased in patients with pre-existing renal failure (especially in diabetic patients)

ACC/AHA 2011 Recommended Indications for Coronary Angiography

- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

Coronary Angiography

Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

Figure 18. Coronary angiogram schematic

AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RCA = right coronary artery
Diagnostic Catheterization
- complications for diagnostic catheterization <1%
- inadequate diagnostic procedures occur in fewer than 1% of cases
- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, or prostacyclin)

Contrast-Enhanced CT Coronary Angiography
- description: fast ECG-synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
- indications: often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
- contraindications: allergy to contrast dye; severe renal dysfunction
- risks: radiation exposure

Magnetic Resonance Imaging
- description: offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
- indications: valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, assessment of viable myocardium, and assessment of cardiomyopathies
- contraindications: metallic foreign bodies/implants
- risks: hazards posed by certain metallic devices inside patients

CAR DiSC HE S

Arrhythmias

Mechanisms of Arrhythmias

Alterations in Impulse Formation

A. Abnormal Automaticity
- automaticity is a property of certain cardiomyocytes to spontaneously depolarize to their threshold voltage to generate action potentials in a rhythmic fashion
- under normal circumstances only cells in the specialized conduction system (SA node, AV node, and ventricular conduction system) exhibit natural automaticity. These cells are pacemaking cells. The automaticity of these cells can become abnormally increased or decreased
- in disease (e.g. post-MI ventricular ischemia) cells in the myocardium outside the conduction system may inappropriately acquire the property of automaticity and contribute to abnormal depolarization. If these ectopic generators depolarize at a rate greater than the SA node, they assume pacemaking control and become the source of abnormal rhythm
- automaticity can be influenced by:
  - neurohormonal tone (sympathetic and parasympathetic stimulation)
  - abnormal metabolic conditions (hypoxia, acidosis, hypothermia)
  - electrolyte abnormalities
  - drugs (e.g. digitalis)
  - local ischemia/infarction
  - other cardiac pathology
- this mechanism is responsible for the accelerated idioventricular rhythm and ventricular tachycardia that often occurs 24-72 h post MI

B. Triggered Activity due to Afterdepolarizations

1. Early Afterdepolarizations
- occur in the context of action potential prolongation
- consequence of the membrane potential becoming more positive during repolarization (e.g. not returning to baseline)
- result in self-maintaining depolarizing oscillations of action potential, generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- basis for the degeneration of QT prolongation, either congenital or acquired, into Torsades de Pointes
2. Delayed Afterdepolarizations
   - occur after the action potential has fully repolarized, but before the next usual action potential, thus
called a delayed afterdepolarization
   - commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or
during enhanced catecholamine stimulation (e.g. "twitchy" pacemaker cells)

**Alterations in Impulse Conduction**

A. Re-Entry Circuits
   - the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of
myocardium (see Figure 26, C20, for an example in the context of AV nodal re-entrant tachycardia)
     - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable
       zones which will promote the formation of re-entry circuits

B. Conduction Block
   - ischemia, fibrosis, trauma, and drugs can cause transient, permanent, unidirectional or bidirectional
     block
   - most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory
     period or zone of myocardium unexcitable due to fibrosis)
   - if block occurs along the specialized conduction system distal zones of the conduction system can
     assume pacemaking control
   - conduction block can lead to bradycardia or tachycardia when impaired conduction leads to re-
     entry phenomenon

C. Bypass Tracts
   - normally the only conducting tract from the atria to the ventricles is the AV node into the His-
     Purkinje system
   - congenital/acquired accessory conducting tracts bypass the AV node and facilitate premature
     ventricular activation before normal AV node conduction
   - see Pre-Excitation Syndromes, C21

---

**Figure 19. Clinical approach to arrhythmias**

- **Bradyarrhythmias (<60 bpm)**
  - Sinus bradycardia
  - Sinoatrial block
  - Sinus arrest
  - AV block (2nd and 3rd degree)
  - Junctional rhythm
  - Idioventricular rhythm

- **Tachyarrhythmias (>100 bpm)**
  - Regular
    - Narrow QRS (SVTs)
      - Sinus tachycardia
      - Atrial tachycardia
      - Junctional tachycardia
      - AVNRT
      - AVRT (orthodromic)
      - Atrial flutter
    - Wide QRS
      - SVT with aberrancy/BBB
      - Ventricular tachycardia
      - AVRT (antidromic)
  - Irregular
    - Narrow QRS (SVTs)
      - Atrial fibrillation
      - A. flutter with variable block
      - Multifocal atrial tachycardia
      - Premature atrial contraction
    - Wide QRS
      - Atrial fibrillation with BBB
      - A. flutter with BBB and variable block
      - Polymorphic VT (torsades)
      - Premature ventricular contraction
Bradyarrhythmias

1. SA NODAL DYSFUNCTION

A. Sinus Bradycardia

- P axis normal (P waves positive in I and aVF)
- Rate < 60 bpm; marked sinus bradycardia (< 50 bpm)
- May be seen in normal adults, particularly athletes, and in elderly individuals
- Increased vagal tone or vagal stimulation; drugs (β-blockers, calcium channel blockers, etc.); ischemia/infarction

- Atropine; pacing for sick sinus syndrome

Figure 20. Sinus bradycardia

2. AV CONDUCTION BLOCKS

A. First Degree AV Block

- Prolonged PR interval (> 200 msec)
- Frequently found among otherwise healthy adults

- No treatment required

Figure 21. First degree AV block

B. Second Degree AV Block: Type I (Mobitz I)

- A gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)
- AV block is usually in AV node (proximal triggers; usually reversible); increased vagal tone (e.g. following surgery), RCA-mediated ischemia

B. Second Degree AV Block: Type II (Mobitz II)

- The PR interval is constant; there is an abrupt failure of conduction of a P wave
- AV block is usually distal to the AV node (i.e. bundle of His); increased risk of high grade or 3rd degree AV block

B. Third Degree AV Block

- Complete failure of conduction of the supraventricular impulses to the ventricles; ventricular depolarization initiated by an escape pacemaker distal to the block
- Wide or narrow QRS, P-P and R-R intervals are constant, variable PR intervals; no relationship between P waves and QRS complexes (P waves “marching through”)

- Management (see Electrical Pacing, C24)

Figure 22. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V1)

Figure 23. Second degree AV block (Mobitz II) (3:2 conduction) (lead V1)

Figure 24. Third degree AV block (complete heart block) (lead II)

Supraventricular Tachyarrhythmias

Presentation for SVT (and Pre-Excitation Syndromes)
- Presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- May precipitate CHF, hypotension, or ischemia in patients with underlying disease
- Untreated tachycardias can cause cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- Includes supraventricular and ventricular rhythms

Supraventricular Tachyarrhythmias
- Tachyarrhythmias that originate in the atria or AV junction
- This term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- Characterized by narrow QRS, unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

1. Sinus Tachycardia
- Sinus rhythm with rate > 100 bpm
- Occurs in normal subjects with increased sympathetic tone (e.g. exercise, emotions, pain), alcohol use, caffeinated beverages, drugs (e.g. β-adrenergic agonists, anticholinergic drugs, etc.)
- Etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, PE, etc.
- Treatment: treat underlying disease; consider β-blocker if symptomatic, calcium channel blocker if β-blockers contraindicated
2. Premature Beats
- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or “traveling backward” P wave)
- treatment usually not required

3. Atrial Flutter
- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly the right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (2:1, 3:1, 4:1, etc.) or variable
- etiology: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy); commonly see HR of 150
- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and bring out flutter waves
- treatment of acute atrial flutter
  - acute and if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable
    - 1. rate control: β-blocker, diltiazem, verapamil, or digoxin
    - 2. chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
  - anticoagulation guidelines same as for patients with AFib
- treatment of long-term atrial flutter: antiarrhythmics, catheter radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter – i.e. whether right-sided isthmus-dependent or left-sided origin)

4. Multifocal Atrial Tachycardia (MAT)
- irregular rhythm caused by presence of 3 or more foci (may mimic AFib)
- atrial rate 100-200 bpm – 3 or more distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD, and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil), β-blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

5. Atrial Fibrillation
- see CCS Atrial Fibrillation Guidelines 2014 for details (free mobile app – iCCS available on iOS and Android)
- most common sustained arrhythmia
- incidence increases with age (10% of population >80 yr old)
- symptoms: palpitations, fatigue, syncope, may precipitate or worsen heart failure
- classification
  - lone: occurs in persons younger than 60 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - permanent/chronic: continuous AFib that is unresponsive to cardioversion or in which clinical judgement has led to a decision not to pursue cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. myocardial infarction, cardiac surgery, pulmonary disease, hyperthyroidism)
  - may be associated with thromboembolic events (stroke risk can be assessed by CHADS2 score in nonvalvular AFib; CHA2DS2-VASc if the former gives a score of 0 or 1)
- initiation
  - single circuit re-entry and/or ectopic foci act as aberrant generators producing atrial tachycardia (350-600 bpm)
  - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
  - in some cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- maintenance
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib the more difficult it is to convert back to sinus rhythm
- consequences
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response of <200 bpm and the tachycardia leads to suboptimal cardiac output
  - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation – AFib is an important risk factor for stroke
Table 5. CHADS2 Risk Prediction for Non-Valvular AFib and Refer to AHA/ACC/HRS AFib Guidelines 2014 for more details

ECG findings
- no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
- irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
- loss of atrial contraction, thus no "a" wave seen in JVP, no S4 on auscultation

Management (adapted from CCS Atrial Fibrillation Guidelines 2012 & 2014)
- major objectives (RACE): all patients with AF (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and for the risk of bleeding, and most patients should receive either an oral anticoagulant or ASA (see below)
- Rate control: β-blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
- 2. Anticoagulation: use either warfarin or direct oral anticoagulant (DOACs) e.g. apixaban, dabigatran, rivaroxaban to prevent thromboembolism
  - for patients with non-valvular AF (NVAF): oral anticoagulant (OAC) is recommended for most patients aged > 65 years or CHADS2 >= 1. ASA 81 mg is recommended only for patients with none of the risk outlined in the CCS algorithm (age < 65 and no CHADS2 risk factors) who have arterial disease (coronary, aortic, or peripheral). Novel oral anticoagulant (NOAC) is to be used in preference to warfarin
- 3. Cardioversion (electrical)
  - if AFib <24-48 h, can usually cardiovert without anticoagulation
  - if AFib >24-48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
  - if patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
- 4. Etiology
  - I – HTN, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
  - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease
- studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control versus rate-control strategy
- however, many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible
- newly discovered AFib
  - anticoagulants may be beneficial if high risk for stroke
  - if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
  - if AFib persists, 2 options
    1. rate control and anticoagulation (as indicated above)
    2. cardioversion (as above)
- recurrent or permanent AFib
  - if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
  - patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations
  - if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
    - no or minimal heart disease: flecainide, propafenone, or sotalol
    - LV dysfunction: amiodarone
    - CAD: β-blockers, amiodarone

Rivaroxaban for Stroke Prevention in AFib – ROCKET-AF Trial
AJEJM 2011;365:883-891
Study: Prospective, non-inferiority, double-blind, RCT, median follow-up of 1.9 yr.
Population: 14,264 patients with AFib (mean CHADS2=3.5). Patients either had previous thromboembolism or ≥3 risk factors.
Intervention: Patients were randomized to receiving rivaroxaban or warfarin.
Outcome: Composite of strokes and systemic thromboembolic event (STE).
Results: The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.88, 95% CI 0.74-1.03; p<0.001 for noninferiority; p=0.12 for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03, 95% CI 0.96-1.11; p=0.64. There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%, p=0.02) and fatal bleeding (0.2% vs. 0.5%, p=0.003) for rivaroxaban.
Conclusions: In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.

Rivaroxaban for Stroke Prevention in AFib – ROCKET-AF Trial
AJEJM 2011;365:883-891
Study: Prospective, non-inferiority, double-blind, RCT, median follow-up of 1.9 yr.
Population: 14,264 patients with AFib (mean CHADS2=3.5). Patients either had previous thromboembolism or ≥3 risk factors.
Intervention: Patients were randomized to receiving rivaroxaban or warfarin.
Outcome: Composite of strokes and systemic thromboembolic event (STE).
Results: The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.88, 95% CI 0.74-1.03; p<0.001 for noninferiority; p=0.12 for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03, 95% CI 0.96-1.11; p=0.64. There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%, p=0.02) and fatal bleeding (0.2% vs. 0.5%, p=0.003) for rivaroxaban.
Conclusions: In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.
6. AV NODAL RE-ENTRANT TACHYCARDIA (AVNRT)

• re-entrant circuit using dual pathways (fast conducting β-fibres and slow conducting α-fibres) within or near the AV node; often found in the absence of structural heart disease – cause is commonly idiopathic, although familial AVNRT has been reported
• sudden onset and offset
• fast regular rhythm: rate 150-250 bpm
• usually initiated by a supraventricular or ventricular premature beat
• AVNRT accounts for 60-70% of all paroxysmal SVTs
• retrograde P waves may be seen but are usually lost in the QRS complex (see Figure 27)
• treatment
  • acute: Valsalva maneuver or carotid sinus pressure technique, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
  • long-term: 1st line – β-blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone; 3rd line – catheter ablation

Pre-Excitation Syndromes

• refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

Wolff-Parkinson-White Syndrome

• congenital defect present in 1.5-2/1,000 of the general population
• an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
• impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively ‘bypassing’ AV node
• since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called “delta wave”
• atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad “fusion complex”
• ECG features of WPW
  • PR interval <120 msec
  • delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  • widening of the QRS complex due to premature activation
  • secondary ST segment and T wave changes
  • tachyarrhythmias may occur – most often AVRT and AFib
**Ventricular Tachyarrhythmias**

**Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)**
- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign but are usually significant in the following situations:
  - consecutive (≥3 = VT) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate ventricular tachycardia or VF

**Accelerated Idioventricular Rhythm**
- ectopic ventricular rhythm with rate 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment

**Ventricular Tachycardia (VT)**
- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate >200 bpm and complexes resemble a sinusoidal pattern
  - "sustained VT" if it lasts longer than 30 s
  - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
  - AV dissociation; bizarre QRS pattern
  - also favour Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")

**monomorphic VT**
- identical complexes with uniform morphology
- more common than polymorphic VT
- typically result from intraventricular re-entry circuit
- potential causes: chronic infarct scarring, acute MI/ischemia, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances

**polymorphic VT**
- complexes with constantly changing morphology, amplitude, and polarity
- more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
- potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation

**treatment**
- sustained VT (>30 s) is an emergency, requiring immediate treatment
- hemodynamic compromise: electrical cardioversion
- no hemodynamic compromise: electrical cardioversion, lidocaine, amiodarone, type Ia agents (procainamide, quinidine)

**AV Re-Entrant Tachycardia**
- re-entrant loop via accessory pathway and normal conduction system
- initiated by a premature atrial or ventricular complex
- orthodromic AVRT: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
- comprises 95% of the reentrant tachycardias associated with WPW syndrome
- antidromic AVRT: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
- treatment
  - acute: similar to AVNRT except avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
  - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
  - drugs such as flecainide and procainamide can be used

**AFib in WPW Patients**
- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - it is usually intermittent rather than persistent or permanent
  - rapid atrial depolarizations in AFib are conducted through the bypass tract which is not able to filter impulses like the AV node can
  - consequently the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens
  - treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction (digoxin, β-blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
  - long-term: ablation of bypass tract if possible

**Arrhythmias**

*If patient >65 yr and previous MI or structural heart disease, then chance of VT >95%
**May terminate VT in some patients with no structural heart disease

Torsades de Pointes
- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – “twisting of the points”
- looks like usual VT except that QRS complexes “rotate around the baseline” changing their axis and amplitude
- ventricular rate >100 bpm, usually 150-300 bpm
- etiology: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing, isoproterenol and correct underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

Ventricular Fibrillation (VFib)
- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and cardiac output, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines
**Sudden Cardiac Arrest**

**Definition**
- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; VFib is most common cause

**Etiology**
- primary cardiac pathology
  - ischemia/MI
  - LV dysfunction
  - severe ventricular hypertrophy
  - HCM
  - AS
  - congenital heart disease e.g. arrhythmogenic right ventricular dysplasia
  - mutations in cardiac ion channels e.g. long QT syndrome, Brugada syndrome

**Management**
- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echo)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, β-blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see Anesthesia and Perioperative Medicine, A31)

**Electrophysiology Studies**
- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of VT

**Electrical Pacing**
- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

**Pacemaker Indications**
- SA node dysfunction (most common): symptomatic bradycardia ± hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

**Pacemaker Complications**
- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome and pacemaker mediated tachycardia

**Pacing Techniques**
- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- can sense and pace atrium, ventricle, or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

**Implantable cardioverter defibrillators**
- sudden cardiac death (SCD) usually results from ventricular fibrillation (VFib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see Heart Failure, C34 for current treatment recommendations
Catheter Ablation

Techniques
- radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: new technology which uses a probe with a tip that can decrease in temperature to -20˚C and -70˚C. Produces small, necrotic lesions similar to RF ablation; when brought to -20˚C, the catheter tip reversibly freezes the area; bringing the tip down to -70˚C for 5 min permanently scars the tissue
  - advantage: can “test” areas before committing to an ablation
  - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)

Indications
- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm, with an accessory AV connection as the retrograde limb
  - corrected by targeting the accessory pathway
- atrial flutter: reentry pathway in right atrium
- AFib: potential role for pulmonary vein ablation
- ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated)

Major Complications
- 1% of patients
- death: 0.1-0.2%
- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

Ischemic Heart Disease

Epidemiology
- most common cause of cardiovascular morbidity and mortality
- Canadian-led INTERHEART study showed that 9 modifiable risk factors accounted for >90% of MI
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
  - according to the Framingham Heart Study, men develop coronary heart disease at a rate double that of women for age <60; incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease see Family Medicine, FM7

* Major risk factor
Figure 35. Pathophysiology of atherosclerosis

**Definition**
- symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

**Etiology and Pathophysiology**
- factors that decrease myocardial oxygen supply
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased SaO₂: hypoxemia
  - congenital anomalies
- factors that increase myocardial oxygen demand
  - increased heart rate: hyperthyroidism
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, aortic stenosis

**Signs and Symptoms**
- typical: (1) retrosternal chest pain, tightness or discomfort radiating to left (+ right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety; (2) predictably precipitated by the "3 Es": exertion, emotion, eating; (3) brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above); non-cardiac chest pain (meets <1 of the above)
- Levine's sign: clenching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

**Clinical Assessment**
- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- stress testing (see Stress Testing, C13) or angiography
- echo
- to assess systolic murmur suggestive of aortic stenosis, mitral regurgitation, and/or HCM
- to assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of CHF

**Differential Diagnosis**
- see Differential Diagnosis of Common Presentations, C4
Treatment of Chronic Stable Angina

1. General Measures
   - goals: to reduce myocardial oxygen demand and/or increase oxygen supply
   - lifestyle modification (diet, exercise)
   - treatment of risk factors: statins (see Endocrinology, E5, Family Medicine, FM9 for target lipid guidelines), antihypertensives, etc.
   - pharmacological therapy to stabilize the coronary plaque to prevent rupture and thrombosis

2. Antiplatelet Therapy (first-line therapy)
   - ASA
   - clopidogrel when ASA absolutely contraindicated

3. β-blockers (first-line therapy – improve survival in patients with hypertension)
   - increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
   - cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β2 receptors)
   - avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

4. Nitrates (symptomatic control, no clear impact on survival)
   - decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
   - maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

5. Calcium Channel Blockers (CCBs, second-line or combination)
   - increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
   - caution: verapamil/diltiazem combined with β-blockers may cause symptomatic sinus bradycardia or AV block

6. ACE Inhibitors (ACEI, not used to treat symptomatic angina)
   - angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
   - benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction, or LV systolic dysfunction)
   - angiotensin II receptor blockers (ARBs) can be used when ACEI contraindicated

7. Invasive Strategies
   - revascularization (see Coronary Revascularization, C31 and COURAGE trial sidebar)

VARIANT ANGINA (PRINZMETAL’S ANGINA)
   - myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
   - uncommonly associated with infarction or LV dysfunction
   - typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
   - typically ST elevation on ECG
   - diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
   - treat with nitrates and CCBs

SYNDROME X
   - typical symptoms of angina but normal angiogram
   - may show definite signs of ischemia with exercise testing
   - thought to be due to inadequate vasodilator reserve of coronary resistance vessels
   - better prognosis than overt epicardial atherosclerosis

Acute Coronary Syndromes

Definition
   - ACS includes the spectrum of UA, NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
   - MI is defined by evidence of myocardial necrosis. It is diagnosed by a rise/fall of serum markers plus any one of
     - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
     - ECG changes (ST-T changes, new BBB or pathological Q waves)
     - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
     - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
   - NSTEMI meets criteria for myocardial infarction without ST elevation or BBB
   - STEMI meets criteria for myocardial infarction characterized by ST elevation or new BBB
• UA is clinically defined by any of the following
  ▪ accelerating pattern of pain: increased frequency, increased duration, decreased threshold of 
    exertion, decreased response to treatment
  ▪ angina at rest
  ▪ new-onset angina
  ▪ angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery 
    bypass grafting [CABG])

Investigations
• history and physical
  ▪ note that up to 30% of MIs are unrecognized or “silent” due to atypical symptoms – more common 
    in women, DM, elderly, post-heart transplant (because of denervation)
• ECG
• CXR
• labs
  ▪ serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see Cardiac Biomarkers, C11)
  ▪ CBC, INR/PTT, electrolytes and magnesium, creatinine, urea, glucose, serum lipids
  ▪ draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

MANAGEMENT OF ACUTE CORONARY SYNDROMES

1. General Measures
  ▪ ABCs: assess and correct hemodynamic status first
  ▪ bed rest, cardiac monitoring, oxygen
  ▪ nitroglycerin SL followed by IV
  ▪ morphine IV

2. Anti-Platelet and Anticoagulation Therapy
  ▪ see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android 
    platforms in the CCS app stores)
  ▪ ASA chewed
  ▪ NSTE
  ▪ ticagrelor in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight 
    heparin or IV unfractionated heparin (UFH) (LMWH preferable, except in renal failure or if 
    CABG is planned within 24 h)
  ▪ clopidogrel used if patient ineligible for ticagrelor
  ▪ if PCI is planned: ticagrelor or prasugrel and consider IV GP IIb/IIIa inhibitor (e.g. abciximab)
  ▪ clopidogrel used if patient ineligible for ticagrelor and prasugrel
  ▪ prasugel contraindicated in those with a history of stroke/TIA, and avoidance of or lower dose is 
    recommended for those >75 yr old or weighing under 60 kg (TRITON-TIMI 38)
  ▪ anticoagulation options depend on reperfusion strategy:
    ▪ primary PCI: UFH during procedure; bivalirudin is a possible alternative
    ▪ thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative
    because of possible rescue PCI
    ▪ no reperfusion: LMWH (enoxaparin) until discharge from hospital
  ▪ continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for 
    thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, 
    or echo evidence of mural thrombus)

3. β-blockers
  ▪ STEMI: contraindications include signs of heart failure, low output states, risk of cardiogenic shock, 
    heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated
  ▪ if β-blockers are contraindicated or if β-blockers/nitrates fail to relieve ischemia, non-
    dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line 
    therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel 
    blockers do not prevent MI or decrease mortality)

4. Invasive Strategies and Reperfusion Options
  ▪ UA/NSTEMI: early coronary angiography ± revascularization if possible is recommended with any 
    of the following high-risk indicators:
    ▪ recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
    ▪ CHF or LV dysfunction
    ▪ hemodynamic instability
    ▪ high (≥3) TIMI risk score (tool used to estimate mortality following an ACS)
    ▪ sustained ventricular tachycardia
    ▪ dynamic ECG changes
    ▪ high-risk findings on non-invasive stress testing
    ▪ PCI within the previous 6 mo
    ▪ repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or 
      high risk features
    ▪ note: thrombolysis is NOT administered for UA/NSTEMI

![TIMI Risk Score for UA/NSTEMI](image-url)
Ischemic Heart Disease

Toronto Notes 2017

C29
Cardiology and Cardiac Surgery

STEMI
- after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
- goal is to re-perfuse artery: thrombolysis ("EMS-to-needle") within 30 min or primary PCI ("EMS-to-balloon") within 90 min (depending on capabilities of hospital and access to hospital with PCI facility)
- thrombolysis
  - preferred if patient presents ≤12 h of symptom onset, and <30 min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
- PCI
  - early PCI (≤12 h after symptom onset and <90 min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
  - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centres (JAMA 2004;291:736-739)
  - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

![Diagnosis STEMI: basic treatment diagram]

**Figure 36. Reperfusion strategy in STEMI**

**Long-Term Management of ACS**
- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

1. **General Measures**
   - education
   - risk factor modification

2. **Antiplatelet and Anticoagulation Therapy**
   - see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
   - ECASA 81 mg daily
   - ticagrelor 90 mg twice daily or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
   - clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
   - ± warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)
3. **β-Blockers** (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

4. **Nitrates**
   - alleviate ischemia but do not improve outcome
   - use with caution in right-sided MI patients who have become preload dependent

5. **Calcium Channel Blockers** (NOT recommended as first line treatment, consider as alternative to β-blockers)

6. **Angiotensin-Converting Enzyme Inhibitors**
   - prevent adverse ventricular remodelling
   - recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
   - recommended for symptomatic CHF, reduced LVEF (<40%), anterior MI
   - use ARBs in patients who are intolerant of ACEI; avoid combing ACE and ARB

7. ± **Aldosterone Antagonists**
   - if on ACEI and β-blockers and LVEF <40% and CHF or DM
   - significant mortality benefit shown with eplerenone by 30d

8. **Statins** (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

9. **Invasive Cardiac Catheterization if indicated** (risk stratification)

### Figure 37. Post-MI risk stratification

**Prognosis following STEMI**

- 5-15% of hospitalized patients will die
  - risk factors
  - infarct size/severity
  - age
  - comorbid conditions
  - development of heart failure or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 mo
  - 4% per year following first yr
  - risk factors
    - LV dysfunction
    - residual myocardial ischemia
    - ventricular arrhythmias
    - history of prior MI

Treatment Algorithm for Chest Pain

Figure 38. Treatment algorithm for patients with symptoms suggestive of an acute coronary syndrome

Coronary Revascularization

PERCUTANEOUS CORONARY INTERVENTION
- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

Indications
- medically refractory angina
- NSTEMI/UA with high risk features (e.g., high TIMI risk score, see sidebar C28)
- primary/rescue PCI for STEMI

Balloon Angioplasty and Intracoronary Stenting
- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS) versus drug-eluting stents: PRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
  - coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus)
  - reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
  - complication: late stent thrombosis (5 events per 1,000 stents implanted)

Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes

- Study: Prospective, double blind, RCT; mean follow-up of 2 yr
- Population: 4,162 patients who had been hospitalized for an ACS within the preceding 10 d.
- Intervention: Patients were randomized to receiving pravastatin 40 mg or atorvastatin 80 mg daily.
- Primary Outcome: Composite of death from any cause, myocardial infarction, documented unstable angina requiring rehospitalization, revascularization (performed at least 30 d after randomization), and stroke.
- Results: High dose atorvastatin was associated with a 16% hazard ratio reduction (p=0.005; 95% CI 5-26%) in the primary outcome compared to standard dose pravastatin.
- Conclusions: In patients who recently experienced an ACS, high dose statin therapy provides greater protection against death and major cardiovascular events than standard dose therapy.
Adjunctive Therapies

- ASA and heparin decrease post-procedural complications
- Further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- Following stent implantation
  - Dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or ≥12 mo with DES
  - DAPT study showed benefit of dual antiplatelet therapy beyond 12 mo
- ASA and prasugrel can be considered for those at increased risk of stent thrombosis

Procedural Complications

- Mortality and emergency bypass rates <1%
- Nonfatal MI: approximately 2-3%

CORONARY ARTERY BYPASS GRAFT SURGERY

- Objective of CABG is complete reperfusion of the myocardium

Indications

- CABG
  - ≥50% diameter stenosis in the left main coronary artery
  - ≥70% diameter stenosis in three major coronary arteries
  - ≥70% diameter stenosis in the proximal LAD artery plus one other major coronary artery
  - Survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant (≥70% diameter) stenosis in a major coronary artery
- Other
  - ≥70% diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
  - ≥70% diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
  - Multivessel CAD in patients with diabetes
  - LV systolic dysfunction (LVEF 35% to 50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- PCI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG
- CABG or PCI
  - One or more significant (≥70% diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

Table 10. Choice of Revascularization Procedure

<table>
<thead>
<tr>
<th>PCI</th>
<th>CABG</th>
</tr>
</thead>
</table>
| **Advantages** | Less invasive technique  
Decreased peri-procedural morbidity and mortality  
Shorter peri-procedural hospitalization |
| **Indications** | Single or double-vessel disease  
Inability to tolerate surgery |
| **CABG** | Greater ability to achieve complete revascularization  
Decreased need for repeated revascularization procedures |
| **Triple-vessel or left main disease** |
| **DM** |
| **Plaque morphology unfavourable for PCI** |

Table 11. Conduits for CABG

<table>
<thead>
<tr>
<th>Conduit</th>
<th>Occlusion/Patency Rate</th>
<th>Considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saphenous Vein (SVG)</td>
<td>10-90% occluded, 25% stenotic, 25% angiographically normal</td>
<td>Used when arterial grafts are not available or many grafts are required, such as triple or quadruple bypass</td>
</tr>
</tbody>
</table>
| Left Internal Thoracic/Mammary Artery (LITA/LIMA) (LIMA to LAD) | 90-95% patency at 15 yr | Most preferred option because of excellent patency  
Improved event-free survival (angina, MI)  
Decreased late cardiac events  
No increase in operative risk |
| Right Internal Thoracic/Mammary Artery (RITA/RIMA) | Pedicled RIMA patency comparable to LIMA  
Free RIMA patency less | Used in bilateral ITA/RMA grafting  
Patients receiving bilateral ITAs/RMAs have less risk of recurrent angina, late MI, angioplasty |
| Radial Artery (free graft) | 85-90% patency at 5 yr | Prone to severe vasospasm post-operatively due to muscular wall |
| Right Gastroepiploic Artery | 80-90% patency at 5 yr | Primarily used as an in situ graft to bypass the RCA  
Use limited because of the fragile quality of the artery, other technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus |
| Complete Arterial Revascularization | For younger patients (< 60 yr of age)  
Is preferred due to longer term graft patency |
| Redo Bypass Grafting | Operative mortality 2-3x higher than first operation  
10% perioperative MI rate  
Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease  
Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts |
Operative Issues
• left ventricular (LV) function is an important determinant of outcome of all heart diseases
• patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
• assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echocardiography, PET scanning, or MRI

CABG and Antiplatelet Regimens
• please refer to CCS guidelines – 2012 update on antiplatelet therapy – for more information if possible
• prior to CABG, clopidogrel and ticagrelor should be discontinued for 5 d and prasugrel for 7 d before surgery
• dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48-72 h after CABG
• ASA (81 mg) continued indefinitely (can be started 6 h after surgery)
• patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

Table 12. Risk Factors for CABG Mortality and Morbidity (decreasing order of significance)

<table>
<thead>
<tr>

<td>DM</td>
</tr>
</tbody>
</table>

Procedural Complications
• CABG using cardiopulmonary bypass (CPB)
  • stroke and neurocognitive defects (macroembolization of gaseous and particulate matter)
  • immunosuppression
  • systemic inflammatory response leading to
    • myocardial dysfunction
    • renal dysfunction
    • neurological injury
    • respiratory dysfunction
    • coagulopathies

OFF-PUMP CORONARY ARTERY BYPASS SURGERY

Procedure
• avoids the use of CPB by allowing surgeons to operate on a beating heart
  • stabilization devices (e.g. Genzyme Immobilizer®) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  • procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

Indications
• used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah’s Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
• absolute contraindications: hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
• relative contraindications: cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

Outcomes
• OPCAB decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
• no significant difference in terms of survival at 2 yr, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG), or medication usage compared to on-pump CABG
Heart Failure

- see also CCS Heart Failure Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores) as well as the CCS Heart Failure Guidelines Compendium available at CCS.ca

### Congestive Heart Failure

#### Low-Output HF due to decreased cardiac output

**Systolic Dysfunction**
- Injury and ischemia in myocardium
- Infarction and inflammation
- Thin, weakened muscle
- Ineffective ventricular contraction

**Diastolic Dysfunction**
- Infiltration and fibrosis
- Thick, stiffened myocardium
- Ineffective ventricular filling

#### High-Output HF due to increased cardiac demand

**Increased Cardiac Workload**
- Myocardial stress
- Volume overload
- Pressure overload

**Compensation**
- Increased heart rate and myocardial contractility
- Increased blood volume

#### Decompensation

- Deterioration of heart function
- Heart unable to maintain blood circulation

#### Systemic Response

- Activation of SNS and RAAS activity

#### Left-Sided HF

- Forward Failure
  - Inability to maintain cardiac output
  - Pulmonary vascular congestion
  - Fluid accumulation in lungs, apnea, shortness of breath, fatigue, weakness

- Backward Failure
  - Elevated ventricular filling pressures
  - Vascular congestion in vena cava
  - Fluid accumulation in lower extremities (edema in feet, ankles, legs, lower back, liver, abdomen), nausea

#### Right-Sided HF

- Backward Failure
  - Elevated ventricular filling pressures
  - Vascular congestion in vena cava
  - Fluid accumulation in lower extremities

- Forward Failure
  - Inability to maintain cardiac output
  - Pulmonary vascular congestion
  - Fluid accumulation in lungs, apnea, shortness of breath, fatigue, weakness

#### Biventricular HF

- Due to long-term left-sided failure leading to right-sided failure
- Disorders affecting entire myocardium

**Dichotomies of Heart Failure**

- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

**Use Ejection Fraction to Grade LV Dysfunction**

- Grade I (EF > 60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)
Pathophysiology
- most common causes are ischemic heart disease, hypertension and valvular heart disease
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodelling
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (concentric remodelling) and eventually interstitial fibrosis
  - volume overload (e.g. AI) leads to dilatation (eccentric remodelling)
- both processes lead to maladaptive changes contributing to disease process
- results in decreased volume cardiac output resulting in activation of the SNS and RAAS
- Na+ and water retention, increasing preload and afterload, tachycardia
- perpetuates cycle of increasing cardiac demand and decompensation

Heart Failure with Reduced Ejection Fraction
- impaired myocardial contractile function → decreased LVEF and SV → decreased CO

Volume Overload and Eccentric Remodelling is the Typical Phenotype
- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF; LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - alcohol (and other toxins)
    - myocarditis
    - dilated cardiomyopathy (multiple causes – see Dilated Cardiomyopathy, C40)

Heart Failure with Preserved Ejection Fraction
- previously known as “diastolic heart failure”
- concentric remodelling with a “stiff” left ventricle is the typical phenotype
- 1/2 of patients with heart failure have preserved EF; confers similar prognosis to HFrEF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal EF
- causes
  - transient: ischemia (relaxation of myocardium is active and requires ATP)
  - permanent
    - severe hypertrophy (HTN, aortic stenosis, HCM)
    - restrictive cardiomyopathy (e.g. amyloid)
  - MI

High-Output Heart Failure
- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget’s disease, renal disease, hepatic disease

Precipitants of Symptomatic Exacerbations
- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection, etc.
  - medication non-compliance
  - dietary indiscretion e.g. salt intake
  - obstructive sleep apnea

Investigations
- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH ± ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchial-alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E/e’), cardiac dimensions, wall motion abnormalities, RVSP (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score

<table>
<thead>
<tr>
<th>Predictor</th>
<th>Possible Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>0-5</td>
</tr>
<tr>
<td>Intermediate</td>
<td>6-8</td>
</tr>
<tr>
<td>High</td>
<td>9-14</td>
</tr>
</tbody>
</table>

Likelihood of heart failure
- Low = 0.5
- Intermediate = 6-8
- High = 9-14

Brain natriuretic peptide (BNP) is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Briaud et al. is commonly used. A score of <4 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 86% and specificity of 84% (p < 0.001) for the diagnosis of acute heart failure.

New York Heart Association (NYHA)

- Class I: ordinary physical activity does not cause symptoms of HF
- Class II: comfortable at rest, ordinary physical activity results in symptoms
- Class III: marked limitation of ordinary activity, less than ordinary physical activity results in symptoms
- Class IV: inability to carry out any physical activity without discomfort; symptoms may be present at rest

Five Most Common Causes of CHF
- CAD (60-70%)
- HTN
- Idiopathic (often dilated cardiomyopathy)
- Valvular (e.g. AS, AR, and MR)
- Alcohol (dilated cardiomyopathy)

Precipitants of Heart Failure

HEART FAILED
- Hypertension (common)
- Endocarditis/environment (e.g. heat wave)
- Anemia
- Rheumatic heart disease and other valvular disease
- Thyrotoxicosis
- Failure to take meds (very common)
- Arrhythmia (common)
- Infection/Ischemia/Infarction (common)
- Lung problems (PE, pneumonia, COPD)
- Endocrine (pheochromocytoma, hyperadrenocorticism)
- Dietary indiscretions (common)
Acute Treatment of Pulmonary Edema
• treat acute precipitating factors (e.g. ischemia, arrhythmias)
• L – Lasix® (furosemide) 40-500 mg IV
• M – morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
• N – nitroglycerin: topical/IV/SL - use with caution in preload-dependent patients (e.g. right HF or RV infarction) as it may precipitate CV collapse
• O – oxygen: in hypoxicemic patients
• P – positive airway pressure (CPAP/BiPAP): decreases preload and need for ventilation when appropriate
• P – position: sit patient up with legs hanging down unless patient is hypotensive
• in ICU setting or failure of LMNOPP, other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    • dopamine
      – low dose: selective renal vasodilation (high potency D1 agonist)
      – medium dose: inotropic support (medium potency β1 agonist)
      – high dose: increases SVR (low potency β1 agonist), which is undesirable
    • dobutamine
      – β1-selective agonist causing inotropy, tachycardia, hypotension (low dose) or hypertension (high dose); most serious side effect is arrhythmia, especially AF
    • phosphodiesterase inhibitors (milrinone)
      – inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
• consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP) if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
• mechanical ventilation as needed
• rarely used, but potentially life-saving measures:
  - intra-aortic balloon pump (IABP) - reduces afterload via systolic unloading and improves coronary perfusion via diastolic augmentation
  - left or right ventricular assist device (LVAD/RVAD)
  - cardiac transplant

Long-Term Management
• overwhelming majority of evidence-based management applies to HREF
• currently no proven pharmacologic therapies shown to reduce mortality in HFPEF; control risk factors (e.g. hypertension)

Conservative Measures
• symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
• lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
• multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

Non-Pharmacological Management
• from CCS guidelines (2013 update)
• cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III with LVEF <40%

Pharmacological Therapy
1. Renin-angiotensin-aldosterone blockade
• ACEI: standard of care – slows progression of LV dysfunction and improves survival
  • all asymptomatic patients functional classes II-IV
  • all asymptomatic patients with LVEF <40%
  • post-MI
  • angiotensin II receptor blockers
    • second-line to ACEI if not tolerated, or as adjunct to ACEI if β-blockers not tolerated
      – combination with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, the need for dialysis and increase (CHARM, ONTARGET)
    • combination angiotensin II receptor blockers with neprilysin inhibitors (ARNI) is a new class of medication that has morbidity and mortality benefit over ACEI alone; it has been recommended to replace ACEI or ARBs for patients who have persistent symptoms (PARADIGM HF)

2. β-blockers: slow progression and improve survival
• class I-III with LVEF <40%
• stable class IV patients
• carvedilol improves survival in class IV HF (COMET)
• note: should be used cautiously, titrate slowly because may initially worsen CHF
3. **Mineralocorticoid receptor (aldosterone) antagonists:** mortality benefit in symptomatic heart failure and severely depressed ejection fraction
   - spironolactone or eplerenone symptomatic heart failure in patients already on ACEI, beta blocker and loop diuretic
   - note: potential for life threatening hyperkalemia
   - monitor K+ after initiation and avoid if Cr >220 μmol/L or K+ >5.2 mmol/L

4. **Diuretics:** symptom control, management of fluid overload
   - furosemide (40-500 mg daily) for potent diuresis
   - metolazone may be used with furosemide to increase diuresis
   - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by β-blockers, ACEI, ARBs, and aldosterone antagonists

5. **Digoxin and cardiac glycosides:** digoxin improves symptoms and decreases hospitalizations, no effect on mortality
   - indications: patient in sinus rhythm and symptomatic on ACEI, or CHF and AFib
   - patients on digitalis glycosides may worsen if these are withdrawn

6. **Antiarrhythmic agents:** for use in CHF with arrhythmia
   - can use amiodarone, β-blocker, or digoxin

7. **Anticoagulants:** warfarin for prevention of thromboembolic events
   - prior thromboembolic event or AFib, presence of LV thrombus on echo

**Procedural Interventions**
- resynchronization therapy: symptomatic improvement with biventricular pacemaker
- consider if QRS >130 msec, LVEF <35%, and persistent symptoms despite optimal therapy
- greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS >150 msec.
- ICD: mortality benefit in 1° prevention of sudden cardiac death
- prior MI, optimal medical therapy, LVEF <30%, clinically stable
- prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see Ventricular Assist Devices, C38)
- cardiac transplantation (see Cardiac Transplantation, C38)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see Valvular Heart Disease, C38)

**Sleep-Disordered Breathing**
- 45-55% of patients with CHF have sleep disturbances, including Cheyne-Stokes breathing and sleep apnea (central or obstructive)
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating symptoms of sleep apnea with secondary beneficial effects in cardiac function and symptoms

**Figure 40. Effect of heart failure treatment on the Frank-Starling curve**

**Chronic Treatment of CHF**
- ACEI
- β-blockers
- Mineralocorticoid receptor antagonists
- Diuretic
- Inotrope
- Antiarrhythmic
- Anticoagulant

**Influence of Ejection Fraction on Cardiovascular Outcomes in a Broad Spectrum of Heart Failure Patients**
- Circulation 2005;112:3738-3744
- **Purpose:** Understand the relationship between ejection fractions and cardiovascular risk in patients with heart failure.
- **Methods:** 7,590 patients from the CHARM study (Candesartan in Heart Failure: Assessment of Reduction in Mortality and morbidity; RCT comparing placebo vs. candesartan in patients with NYHA class II vs. IV). Compared LVEF to cardiovascular outcomes and causes of death.
- **Results:** All-cause mortality increased by 30% per 10% reduction in LVEF below 45% (Hazard ratio 1.39, 95% CI 1.32-1.46). For LVEF>45%, ejection fraction does not further contribute to assessment of cardiovascular risk in HF patients.
- **Conclusions:** At LVEF<45%, lower ejection fractions were associated with poorer cardiovascular outcomes.

**Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function**
- Am Heart J 2006;151:444-450
- **Purpose:** To establish the association between NYHA classes and outcomes with heart failure and preserved systolic function.
- **Methods:** Retrospective follow-up study (median 38.5 mo) of 988 patients with heart failure with ejection fraction >45%. Estimated risks of various outcomes using Cox proportional hazard models.
- **Results:** Adjusted hazard ratio for all-cause mortality for NYHA class II, III, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted hazard ratio for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.
- **Conclusions:** Higher NYHA classes were associated with poorer outcomes in patients with heart failure and preserved systolic function. Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.
Cardiac Transplantation

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1 yr survival is 85-90%, 5 yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

Indications for Surgery
- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF; NYHA III or IV; peak metabolic oxygen consumption <14 mL/kg/min in absence of β-blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF <30%; recurrent, symptomatic ventricular arrhythmias)
- exclusion of all surgical alternatives to cardiac transplantation

Prerequisites
- psychosocial stability
- medically compliant and motivated
- relative contraindications: incurable malignancy, major systemic illness, irreversible major organ disease, active systemic infection, obesity, irreversible pulmonary HTN (pulmonary vascular resistance [PVR] >6 Wood units), severe COPD (FEV1 <1 L) or active drug addiction or alcoholism

Complications
- rejection
  - common, <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft CAD
  - approximately 50% develop graft CAD within 5 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
- cutaneous neoplasms most common, followed by non-Hodgkin's lymphoma and lung cancer
- immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BVAD)
- indications
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy (“destination therapy”)
  - post-operative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
  - IABP is a catheter based device inserted into the femoral artery and advanced to the descending aorta that decreases myocardial O2 demand and increases blood flow to coronary arteries
  - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
- post-operative cardiogenic shock
Myocardial Disease

Definition of Cardiomyopathy
- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2° to MI often termed “ischemic cardiomyopathy”, is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

Myocarditis

Definition
- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

Etiology
- idiopathic
- infectious
  - viral (most common): parvovirus B19, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps
  - bacterial: S. aureus, C. perfringens, C. diphtheriae, Mycoplasma, Rickettsia
  - fungi
  - spirochetal (Lyme disease – Borelia burgdorferi)
  - Chagas disease (Trypanosoma cruzi), toxoplasmosis
  - toxic: catecholamines, chemotherapy, cocaine
  - hypersensitivity/eosinophilic: drugs (antibiotics, diuretics, lithium, clozapine), insect/snake bites
  - systemic diseases: collagen vascular diseases (SLE, rheumatoid arthritis, others), sarcoidosis, autoimmune
  - other: giant cell myocarditis, acute rheumatic fever

Signs and Symptoms
- constitutional symptoms
- acute CHF - dyspnea, tachycardia, elevated JVP
- chest pain – due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- pre-syncpe/syncope/sudden death

Investigations
- ECG: non-specific ST-T changes ± conduction defects
- blood work
  - increased CK, troponin, LDH, and AST with acute myocardial necrosis ± increased WBC, ESR, ANA, rheumatoid factor, complement levels
  - blood culture, viral titres and cold agglutinins for Mycoplasma
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- cardiovascular magnetic resonance: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- myocardial biopsy

Management
- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible
Prognosis
- often unrecognized, and may be self-limited
- myocarditis treatment trial showed 5 yr mortality between 25-50%
- giant cell myocarditis, although rare can present with fulminant CHF and be rapidly fatal, with 5 yr mortality >80%
- sudden death in young adults
- may progress to dilated cardiomyopathy

Dilated Cardiomyopathy

Definition
- unexplained dilation and impaired systolic function of one or both ventricles

Etiology
- idiopathic (presumed viral or idiopathic) ~50% of DCM
- alcohol
- familial/genetic
- uncontrolled tachycardia (e.g. persistent rapid AFib)
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich’s ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
toxic: cocaine, heroin, organic solvents
drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
radiation

Signs and Symptoms
- may present as
  - CHF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

Investigations
- blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, TIBC
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (non-sustained VT)
- CXR: global cardiomegaly (globular heart), signs of CHF, pleural effusion
- echo: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in selected patients to exclude ischemic heart disease

Management
- treat underlying disease: e.g. abstinence from alcohol
- treat CHF: see Heart Failure, C34
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
- treat symptomatic or serious arrhythmias
- immunize against influenza and S. pneumoniae
- consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
- consider ICD among patients with a LVEF <30%

Prognosis
- depends on etiology
- better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
- cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in 1st yr, 10% per year after
Hypertrophic Cardiomyopathy

- see 2011 ACCF/AHA Guideline for the Diagnosis and Treatment of Hypertrophic Cardiomyopathy for details

Definition
- defined as unexplained ventricular hypertrophy
- various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

Etiology and Pathophysiology
- histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- prevalence of 1/500-1/1,000 in general population
- generally presents in early adulthood

Hemodynamic Classification
- hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
  - dynamic i.e. obstruction (and the murmur) is reduced with maneuvers that increase preload, and augmented with maneuvers that reduce preload
- non-obstructive HCM: no LVOT obstruction
- many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

Signs and Symptoms
- clinical manifestations: asymptomatic (common, therefore screening is important), SOB on exertion, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, “spike and dome” pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, ‘triple ripple’ (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat to standing or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

Investigations
- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR, LVOT gradient can be estimated by Doppler measurement
- genetic studies (± magnetic resonance imaging) can be helpful when echocardiography is inconclusive for diagnosis
- cardiac catheterization (only when patient being considered for invasive therapy)

Management
- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of all competitive sports
- treatment of obstructive HCM
  - medical agents: β-blockers, disopyramide, verapamil (started only in monitored setting), phenylephrine (in setting of cardiogenic shock)
  - avoid nitrates, diuretics, and ACEI as they increase LVOT gradient and worsen symptoms
- patients with obstructive HCM and drug-refractory symptoms
  - surgical myectomy
  - alcohol septal ablation - percutaneous Intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - dual chamber pacing (rarely done)
- treatment of patients at high risk of sudden death : ICD
  - first-degree relatives (children, siblings, parents) of patients with HCM should be screened (physical, ECG, 2D echo) every 12-18 mo during adolescence, then serially every 5 yr during adulthood

Prognosis
- potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
  - major risk factors for sudden death (consider ICD placement)
  - history of survived cardiac arrest/sustained VT
  - family history of multiple premature sudden deaths
  - other factors associated with increased risk of sudden cardiac death
    - syncope (presumed to be arrhythmic in origin)
    - non-sustained VT on ambulatory monitoring
    - marked ventricular hypertrophy (maximum wall thickness ≥30 mm)
    - abnormal BP in response to exercise (in patients <40 yr old with HCM)

RCM vs. Constrictive Pericarditis (CP)
Present similarly but CP is treatable with surgery
## Restrictive Cardiomyopathy

### Definition
- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

### Etiology
- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis
- storage diseases: hemochromatosis, Fabry’s disease, Gaucher’s disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis, Loeffler’s endocarditis, or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

### Clinical Manifestations
- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul’s sign
- S3, S4, MR, TR
- thromboembolic events

### Investigations
- ECG: low voltage, non-specific, diffuse ST-T wave changes ± non-ischemic Q waves
- CXR: mild cardiac enlargement
- Echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

### Management
- exclude constrictive pericarditis
- treat underlying disease: control HR, anticoagulate if AFib
- supportive care and treatment for CHF, arrhythmias
- heart transplant: might be considered for CHF refractory to medical therapy

### Prognosis
- depends on etiology
Valvular Heart Disease

- see Guidelines on the Management of Valvular Heart Disease. JACC Jun 10;63(22):2438-88 for details

Infected Endocarditis
- see Infectious Diseases, ID16
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with
    - prosthetic valve material
    - past history of IE
    - certain types of congenital heart disease
    - cardiac transplant recipients who develop valvulopathy
  - only for the following procedures
    - dental
    - respiratory tract
    - procedures on infected skin/skin structures/MSK structures
    - not GI/GU procedures specifically

Increased risk of hemorrhage: 1-2%/yr

Target INR

Requires long-term anticoagulation with coumadin

Decreased risk of thromboembolism: long-term anticoagulation not needed for aortic valves

Mitrail Valve Repair vs. Replacement for Severe Ischemic Mitral Regurgitation
NEJM 2014;370:23-32

Purpose: Ischemic mitral regurgitation is associated with significant mortality risk. The purpose of this study was to compare the effectiveness and safety of repairing versus replacing the mitral valve in patients with severe chronic ischemic mitral regurgitation.

Study Design: RCT with 251 patients with severe ischemic mitral regurgitation were randomly assigned to mitral valve repair or chordal-sparing replacement. The primary endpoint was the left ventricular end-systolic volume index (LVESVI) at 12 mo.

Results: There were no significant between-group differences in LVESVI, in the rate of major adverse cardiac or cerebrovascular events, in functional status, or in quality of life at 12 mo. The rate of moderate or severe mitral regurgitation recurrence at 12 mo was significantly higher in the repair group than in the replacement group (22.8% vs. 2.3%, respectively).

Conclusions: No significant difference in left ventricular reverse remodeling or survival at 12 mo between patients who underwent mitral valve repair or replacement. Replacement provided more durable correction of mitral regurgitation, but there were no significant differences in clinical outcomes.

Rheumatic Fever
- see Pediatrics, PS8

Prognosis
- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

Valve Repair and Valve Replacement

- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease as well as a variety of valve diseases associated with aging
- valve repair: balloon valvuloplasty, surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendinae shortening, tissue patch
- valve replacement: typically for aortic or mitral valves only; mitral valve repair is favoured in younger individuals; percutaneous techniques being established

Choice of Valve Prosthesis

Decreased risk of hemorrhage
# Summary of Valvular Disease

## Aortic Stenosis (AS)

### Etiology
- Congenital (bicuspid, unicuspid valve)
- Calcification (wear and tear)
- Rheumatic disease

### Definition
- Normal aortic valve area = 3-4 cm²
- Mild AS: 1.5 to 3 cm²
- Moderate AS: 1.0 to 1.5 cm²
- Severe AS: < 1.0 cm²
- Critical AS: < 0.5 cm²

### Pathophysiology
- Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF
- Subendocardial ischemia

### Symptoms
- Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema

### Physical Exam
- Narrow pulse pressure, brachial-radial delay, pulsed parvus et tardus, sustained PMI
- Auscultation: crescendo-decrescendo SEM radiating to R clavicle and carotid, musical quality at apex (Gallavardin phenomenon)

### Investigations
- ECG: LV strain, BBBB, LAE, A fib
- CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF
- Echo: reduced valve area, pressure gradient, LVH, reduced LV function

### Treatment
- Asymptomatic: serial echos, avoid exertion
- Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS
- Symptomatic: decrease preload (diuretics), increase afterload (ACEI) for severe MR and LV dysfunction

### Intervventional Options
- Percutaneous valve replacement (transfemoral or transapical approach)
- is an option in selected patients who are not considered good candidates for surgery

## Mitral Stenosis (MS)

### Etiology
- Rheumatic disease most common
- Cause, congenital (rare)

### Definition
- Severe MS is mitral valve area (MVA) < 1.5 cm²

### Pathophysiology
- MS → fixed CD and LAE → increased LA pressure → pulmonary vascular resistance and CHF; worse with Afib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)

### Symptoms
- SOB on exertion, orthopnea, fatigue, palpitations, peripheral edema, molar flush, pinched and blue facies (severe MS)

### Physical Exam
- Afib, no "a" wave on JVP, left parasternal lift palpable diastolic thrill at apex
- Auscultation: mid-diastolic rumble at apex, best heard with bell in left lateral decubitus position following exertion, loud S1 OS following loud P2 (heard best during expiration), long diastolic murmur and short A2-OS interval correlate with worse MS

### Investigations
- ECG: HSRAFib, RVH, RAD
- CXR: LAE, CHF, mitral valve calcification
- Echo/TTE: shows restricted opening of mitral valve
- Cath: indicated in concurrent CAD if > 40 yr (male) or > 50 yr (female)

### Treatment
- Avoid exertion, fever (increased LA pressure), treat Afib and CHF, increase diastolic filling time (β-blockers, digitalis)
- Surgery if: NYHA class III-IV CHF and failure of medical therapy

### Invasive Options
- Percutaneous balloon valvuloplasty: young rheumatic pts and good leaflet morphology (can be determined by echo), asymptomatic pts with moderate-severe MS, pulmonary HTN
- Contraindication: left atrial thrombus, moderate MR
- Open Mitral Commissurotomy: if mild calcification + leaflet/chordal thickening
- Restenosis in 50% pts in 8 yr
- Valve replacement: indicated in moderate-severe calcification and severely scarred leaflets

## Mitral Regurgitation (MR)

### Etiology
- Mitral valve prolapse, congenital cleft leaflets, LV dilatation/aneurysm (CHF, DCM, myocarditis)
- JE abscess, Marfan’s syndrome, HOCM, acute MI, myxoma
- Mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease

### Pathophysiology
- Reduced CO → increased LV and LA pressure → LV dilatation → CHF and pulmonary HTN

### Symptoms
- Dyspnea, PND, orthopnea, palpitations, peripheral edema

### Physical Exam
- Displaced hyperdynamic apex, left parasternal lift, apical thrill
- Auscultation: holosystolic murmur at apex, radiating to axilla ± mid-diastolic rumble, loud S2 (if pulmonary HTN), S3

### Investigations
- ECG: LAE, RVH, RAD
- CXR: LAH, pulmonary venous HTN
- Echo: etiology and severity of MR, LV function, leaflets
- Swan-Ganz Catheter: prominent LA "v" wave

### Treatment
- Asymptomatic: serial echos
- Symptomatic: decrease preload (diuretics), decrease afterload (ACEI) for severe MR and poor surgical candidates; stabilize acute MR with vasodilators before surgery
- Surgery if: acute MR with CHF, papillary muscle rupture, NYHA class III-IV CHF; AF; increasing LV size or worsening LV function, earlier surgery if valve repairable (>90% likelihood) and patient is low-risk for surgery

### Surgical Options
- Valve repair: > 70% of pts with MR and myxomatous mitral valve prolapse – annuloplasty rings, leaflet repair, chordae transfers/shorten/replacement
- Valve replacement: failure of repair, heavily calcified annulus
- Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation

## Aortic Regurgitation (AR)

### Etiology
- Supravalvular: aortic root disease
- (Marfan’s, atherosclerosis and dissecting aneurysm, connective tissue disease)
- Valvular: congenital (bicuspid aortic valve, large VSD), IE

### Pathophysiology
- Volume overload → LV dilatation → increased SV, high sBP and low dBP → increased wall tension → pressure overload → LVH (low dBP → decreased coronary perfusion)

### Symptoms
- Usually only becomes symptomatic late in disease when LV failure develops
- Dyspnea, orthopnea, PND, syncope, angina

### Physical Exam
- Waterhammer pulse, bisferiens pulse, femoral-brachial sBP > 20 (Hill’s test wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex
- Auscultation: early decrescendo diastolic murmur at LLB (cuspid pathology) or RLSB (aortic root pathology), best heard sitting, leaning forward, on full expiration, soft S1, absent S2, S3 (late)

### Investigations
- ECG: LVH, LAE
- CXR: LVH, LAE, aortic root dilation
- Echo/TTE: quantity AR, leaflet or aortic root anomalies
- Cath: if > 40 yr and surgical candidate – to assess for ischemic heart disease

### Exercise testing: hypotension with exercise

### Treatment
- Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)
- Symptomatic: avoid exertion, treat CHF
- Surgery if: NYHA class III-IV CHF; LV dilatation and/or LVEF < 50% with/without symptoms

### Surgical Options
- Valve replacement: most patients
- Valve repair: very limited role
- Aortic root replacement (Bentall procedure):
  - when ascending aortic aneurysm present, valved conduit used

---

C44  Cardiology and Cardiac Surgery

Valvular Heart Disease

Table 16. Valvular Heart Disease (continued)

**Mitral Valve Stenosis (MS)**
- **Etiology**: Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS
- **Pathophysiology**: Increased RA pressure → right heart failure → decreased CD and fixed on exertion
- **Symptoms**: Peripheral edema, fatigue, palpitations
- **Physical Exam**: Prominent "a" waves in JVP. +ve abdominojugular reflux, Kussmaul’s sign, diastolic rumble 4th left intercostal space
- **Investigations**: ECG: RAE
- **Treatment**: Preload reduction (diuretics), slow HR
- **Surgical Options**: Valve Replacement: – if severely diseased valve – bioprosthesis preferred

**Mitral Valve Prolapse (MVP)**
- **Etiology**: Myxomatous degeneration of chordae, thick, bulky leaflets that crowd orifice, associated with Marfan’s syndrome, pectus excavatum, straight back syndrome, other MSK abnormalities; <3% of population
- **Pathophysiology**: Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms
- **Symptoms**: Prolonged, stabbing chest pain, dyspnea, anxiety/panic, palpitations, fatigue, presyncope
- **Physical Exam**: Auscultation: mid-systolic click (due to billowing of mitral leaflet into LA); tensing of redundant valve tissue; mid to late systolic murmur at apex, accentuated by Valsalva or squat-to-stand maneuvers
- **Investigations**: ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy Echo: systolic displacement of thickened mitral valve leaflets into LA
- **Treatment**: Asymptomatic: no treatment; reassurance Symptomatic: β-blockers and avoidance of stimulants (caffeine) for significant palpitations, anticoagulation if AFib
- **Surgical Options**: Mitral valve surgery (repair favoured over replacement) if symptomatic and significant MR

**Pulmonary Stenosis (PS)**
- **Etiology**: Usually congenital, rheumatic disease (rare), carcinoid syndrome
- **Pathophysiology**: Increased RV pressure → RV hypertrophy → right heart failure
- **Symptoms**: Chest pain, syncope, fatigue, peripheral edema
- **Physical Exam**: Systolic murmur at 2nd left intercostal space accentuated by inspiration, pulmonary ejection click, right-sided S4
- **Investigations**: ECG: RVR
- **Treatment**: Balloon valvuloplasty if severe symptoms
- **Surgical Options**: Percutaneous or open balloon valvuloplasty

**Tricuspid Stenosis (TS)**
- **Etiology**: Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS
- **Pathophysiology**: Increased RA pressure → right heart failure → decreased CD and fixed on exertion
- **Symptoms**: Peripheral edema, fatigue, palpitations
- **Physical Exam**: Prominent "a" waves in JVP. +ve abdominojugular reflux, Kussmaul’s sign, diastolic rumble 4th left intercostal space
- **Investigations**: ECG: RAE
- **Treatment**: Preload reduction (diuretics), slow HR
- **Surgical Options**: Valve Replacement: – if severely diseased valve – bioprosthesis preferred

**Tricuspid Regurgitation (TR)**
- **Etiology**: RV dilatation, IE (particularly due to IV drug use), rheumatic disease, congenital (Ebstein anomaly), carcinoid
- **Pathophysiology**: RV dilatation → TR further RV dilatation → right heart failure
- **Symptoms**: Peripheral edema, fatigue, palpitations
- **Physical Exam**: "cv" waves in JVP. +ve abdominojugular reflux, Kussmaul’s sign, holosystolic murmur at LLSB accentuated by inspiration, left parasternal lift
- **Investigations**: ECG: RAE, RVH, AFib
- **Treatment**: Preload reduction (diuretics) Surgery if: only if other surgery required (e.g. mitral valve replacement)
- **Surgical Options**: Annuloplasty (i.e. repair, rarely replacement)

**Pulmonary Regurgitation (PR)**
- **Etiology**: Pulmonary HTN, IE, rheumatic disease, tetrology of Fallot (post-repair)
- **Pathophysiology**: Increased RV volume → increased wall tension → RV hypertrophy → right heart failure
- **Symptoms**: Chest pain, syncope, fatigue, peripheral edema
- **Physical Exam**: Early diastolic murmur at LLSB, Graham Steell (diastolic) murmur 2nd and 3rd left intercostal space increasing with inspiration
- **Investigations**: ECG: RAE, RVH
- **Treatment**: Rarely requires treatment; valve replacement (rarely done)
- **Surgical Options**: Pulmonary valve replacement

**Pulmonary Valve Replacement**
- **Surgical Options**: Rarely requires treatment; valve replacement (rarely done)
Valvular Heart Disease

C46  Cardiology and Cardiac Surgery

Figure 41. Hemodynamics of aortic stenosis
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2.

Figure 42. Hemodynamics of aortic regurgitation
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume.

Figure 43. Hemodynamics of acute mitral regurgitation
During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end-diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP).

Figure 44. Hemodynamics of mitral stenosis
First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible.
**Pericardial Disease**

**Acute Pericarditis**

**Etiology of Pericarditis/Pericardial Effusion**
- idiopathic is most common: presumed to be viral
- infectious
  - viral: Coxsackie virus A, B (most common), echovirus
  - bacterial: *S. pneumoniae*, *S. aureus*
  - TB
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler’s syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin’s, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (sarcoid)

**Signs and Symptoms**
- diagnostic triad: chest pain, friction rub and ECG changes (diffuse ST elevation and PR depression with reciprocal changes in aVR)
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi-, or triphasic; evanescent and rare
- ± fever, malaise

**Investigations**
- ECG: initially diffused elevated ST segments ± depressed PR segment, the elevation in the ST segment is concave upwards → 2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- Echo: performed to assess for pericardial effusion

**Treatment**
- treat the underlying disease
- anti-inflammatory agents (high dose NSAIDs/ASA, steroids use controversial), analgesics

**Complications**
- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

**Pericardial Effusion**

**Etiology**
- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

**Signs and Symptoms**
- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant “x” descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds ± rub
- Ewart’s sign

**Investigations**
- ECG: low voltage, flat T waves, electrical alternans (classic, but not sensitive to exclude effusion)
  - be cautious in diagnosing STEMI in a patient with pericarditis and an effusion - antiplatelets may precipitate hemorrhagic effusion
- CXR: cardiomegaly, rounded cardiac contour
- ER: bedside ultrasound with subxiphoid view showing fluid in pericardial sac
- Echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement
### Treatment
- mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
- severe: treat as in tamponade (see Cardiac Tamponade)

### Cardiac Tamponade

#### Etiology
- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

#### Pathophysiology
- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

#### Signs and Symptoms
- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in systolic BP >10 mmHg during quiet breathing)
- JVP “x” descent only, blunted “y” descent
- hepatic congestion/peripheral edema

#### Investigations
- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
- cardiac catheterization

#### Treatment
- pericardiocentesis: Echo-guided
- pericardiotomy
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO)
- IV fluid may increase CO
- treat underlying cause

### Constrictive Pericarditis

#### Etiology
- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

#### Signs and Symptoms
- dyspnea, fatigue, palpitations
- abdominal pain
- may mimick CHF (especially right-sided HF)
  - ascites, hepatosplenomegaly, edema
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent “y” descent)
- BP usually normal (and usually no pulsus paradoxus)
- precordial examination: + pericardial knock (early diastolic sound)
- see Table 17 for differentiation from cardiac tamponade

#### Investigations
- ECG: non-specific – low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/MRI: pericardial thickening, ± characteristic echo-Doppler findings
- cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

#### Treatment
- medical: diuretics, salt restriction
- surgical: pericardiectomy (only if refractory to medical therapy)
- prognosis best with idiopathic or infectious cause and worst in post-radiation; death may result from heart failure

General Principles

Drug Nomenclature

- **chemical name**: describes chemical structure; consistent in all countries (e.g. N-(4-hydroxyphenyl) acetamide is acetaminophen)
- **DIN or NDC**: DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name**: approved name (post-phase III trial), official name (listed in pharmacopoeia), or generic name (off-patent) such as acetaminophen
- **proprietary (trade) name**: the brand name or registered trademark (e.g. Tylenol™)

Phases of Clinical Drug Testing

- **pre-clinical**: testing a drug in a controlled environment (lab) on animal or human cells before human testing to discern the PK and toxicological profile
- **phase I**: first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II**: first administration to patients, small sample sizes; to determine initial safety and efficacy, dose range, PK, and PD
- **phase III**: large sample sizes, often double-blinded RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV**: post-marketing surveillance, wide distribution; to determine effects of long-term use, rare ADRs, ideal dosing, and effects in real-world practice

Drug Administration

- choice of route of administration depends on: drug properties, local and systemic effects, desired onset and/or duration of action, and patient characteristics

### Table 1. Routes of Drug Administration

<table>
<thead>
<tr>
<th>Route</th>
<th>Advantage</th>
<th>Disadvantage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oral (PO)</td>
<td>Convenient, easy to administer</td>
<td>Incomplete absorption, Hepatic first-pass effect</td>
</tr>
<tr>
<td></td>
<td>Large surface area for absorption</td>
<td>Potential GI irritation</td>
</tr>
<tr>
<td></td>
<td>Inexpensive relative to parenteral administration</td>
<td></td>
</tr>
<tr>
<td>Buccal/Sublingual (SL)</td>
<td>Rapid onset of action</td>
<td>Must be lipid-soluble, non-irritating, Short duration of action</td>
</tr>
<tr>
<td>Rectal (PR)</td>
<td>Almost no hepatic first-pass effect</td>
<td>Inconvenient, irritation at site of application</td>
</tr>
<tr>
<td></td>
<td>Use when NPO, vomiting, or unconscious</td>
<td>Erratic absorption</td>
</tr>
<tr>
<td>Intravenous (IV)</td>
<td>No hepatic first-pass effect</td>
<td>Hard to remove once administered</td>
</tr>
<tr>
<td></td>
<td>Slow infusion or rapid onset of action</td>
<td>Risk of infection, bleeding, vascular injury extravasation</td>
</tr>
<tr>
<td></td>
<td>Easy to titrate dose</td>
<td>Expensive</td>
</tr>
<tr>
<td>Intramuscular (IM)</td>
<td>Depot storage if oil-based = slow release of drug</td>
<td>Pain/hematoma at site of injection</td>
</tr>
<tr>
<td></td>
<td>Aqueous solution = rapid onset of action</td>
<td></td>
</tr>
<tr>
<td>Subcutaneous (SC)</td>
<td>Non-irritating drugs, small volumes</td>
<td>Pain at site of injection, Smaller volumes than IM, May have tissue damage from multiple injections</td>
</tr>
<tr>
<td></td>
<td>Constant, even absorption</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Alternative to IV</td>
<td></td>
</tr>
<tr>
<td>Intrathecal</td>
<td>Direct into CSF, Bypass BBB and blood-CSF barrier</td>
<td>Risk of infection</td>
</tr>
<tr>
<td>Inhalation</td>
<td>Immediate action in lungs, Rapid delivery to blood</td>
<td>Must be gas, vapour, or aerosol</td>
</tr>
<tr>
<td>Topical</td>
<td>Easy to administer, Localized (limited systemic absorption)</td>
<td>Effects are mainly limited to site of application</td>
</tr>
<tr>
<td>Transdermal</td>
<td>Drug absorption through intact skin</td>
<td>Irritation at site of application, Delayed onset of action</td>
</tr>
<tr>
<td></td>
<td>No hepatic first-pass effect</td>
<td>Hydrophilic drugs not easily absorbed</td>
</tr>
<tr>
<td>Others (intraperitoneal, intra-articular)</td>
<td>Local effect</td>
<td>Risk of infection</td>
</tr>
</tbody>
</table>
Pharmacokinetics

- **study of “what the body does to a drug”**
- **definition**: relationship between drug administration, time-course/rate of absorption and distribution, concentration changes in the body compartments, and the drug's removal from the body

### Absorption

- **definition**: movement of the drug from the site of administration into plasma

#### Mechanisms of Drug Absorption
- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms include active transport, facilitated diffusion, and pinocytosis/phagocytosis

#### Factors Affecting the Rate and Extent of Drug Absorption
- \( P_{ow} \)
  - local blood flow at the site of administration (e.g. sublingual vessels facilitate rapid absorption of sublingual medications)
- **molecular size** (e.g. drugs with smaller molecular weight absorb faster)
- **pH and drug ionization**
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms
  - non-ionized forms cross cell membranes much faster than ionized (charged) forms
  - the ratio of ionized to non-ionized forms is determined by body compartment pH and drug pKa
    - (HH equation)
- **total surface area for absorption**
  - small intestinal villi are the primary site of absorption for most oral drugs

#### Bioavailability (F)
- **definition**: proportion of dose that reaches systemic circulation in an unchanged state
- decreased by limited drug absorption or first-pass effect
- IV dose has 100% bioavailability (F = 1)

#### First-Pass Effect
- **definition**: drug metabolism by the liver and/or the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- occurs less with PR administration because drug absorbed in colon bypasses the portal system

#### Efflux Pump
- Pgp is a protein found in various parts of the body that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- for example, opposes intestinal absorption (e.g. dabigatran etexilate) and also enhances renal elimination of certain drugs (e.g. digoxin, etoposide, paclitaxel, tacrolimus, cyclosporine)
- some drugs (e.g. macrolide antibiotics) inhibit Pgp function, leading to increased serum levels of drugs transported by Pgp: Pgp inducers (e.g. St. John's wort) do the opposite
- some tumours overexpress Pgp leading to multidrug resistance to chemotherapeutic agents

### Distribution

- **definition**: movement of drugs between different body compartments and to the site of action
- major body fluid compartments include plasma, interstitial fluid, intracellular fluid, transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments include fat, brain

#### Factors Affecting the Rate and Extent of Drug Distribution
- physicochemical properties of the drug (e.g. \( P_{ow} \) and pK)
- pH of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow

---

**Figure 1. Distribution of total body water (TBW)**

- **Total Body Water**: 60% of body weight
- **Extracellular Fluid**: 16-20%
  - **Intravascular Plasma**: 4%
  - **Interstitial Fluid**: 12-15%
- **Intracellular Fluid**: 40-44%

- **P<sub>ow</sub>**: Ratio of a drug's solubility in oil/lipid (e.g. cell membrane) as compared to water (e.g. extracellular fluid)
- A large \( P_{ow} \) (e.g. anesthetics) means that a drug is highly soluble in lipid and will cross cell membranes easily

**Examples of Drugs with High First-Pass Effect**
- Levodopa
- Morphine
- Propranolol
- Lidocaine
- Organic nitrates

**Examples of Drugs with Low First-Pass Effect**
- Diazepam
- Digosin
- Phenytoin
- Warfarin
Volume of Distribution
- $V_d$: the apparent volume of fluid into which a drug distributes
- maximum actual $V_d$ (anatomic fluid volume accessible to drug) = TBW (TBW ~ 40 L for average adult)
  - a calculated value ($V_d$) = amount of drug in body ÷ plasma drug concentration
  - a theoretical value that does not correspond to an anatomical space (i.e. can exceed TBW)
- small $V_d$ corresponds to a drug that concentrates in plasma and/or binds plasma proteins to a high degree
- large $V_d$ corresponds to a drug that distributes into tissues (fat, muscle, etc.); most is not in blood (measured) space, and it therefore "appears" to distribute in a large volume
- $V_d$ of plasma protein bound drugs can be altered by liver and kidney disease
- example: amiodarone distributes into TBW (actual $V_d$ = 40 L), but it also concentrates in fat tissues giving instead an apparent $V_d$ of 400 L; therefore, to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

Plasma Protein Binding
- drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to α1-acid glycoprotein
  2. free or unbound: can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often metabolized with no harmful effects, although toxicity is possible

Depots
- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wk)

Barriers (relative)
- body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. Pgp), which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers

Metabolism (Biotransformation)
- definition: chemical transformation of a drug in vivo to enhance elimination
- sites of biotransformation include liver (main), GI tract, lung, plasma, kidney
- as a result of the process of biotransformation:
  - an inactive prodrug may be activated (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be changed to another active metabolite (e.g. diazepam to oxazepam)
  - a drug may be changed to a toxic metabolite (e.g. meperidine to normeperidine)
  - a drug may be inactivated (most drugs)

Drug Metabolizing Pathways
- phase I (P450) reactions
  - minor molecular changes introduce or unmask polar groups on a parent compound to increase water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation); the change in $P_{\text{app}}$ is typically minimal compared to phase II, and often phase I places a polar 'handle' on a lipophilic drug to allow for phase II
  - mediated by CYPs found in the endoplasmic reticulum
  - product of the reaction can be excreted or undergo further phase II reactions
- phase II (conjugation) reactions
  - conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
  - dramatically increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. glucuronides of morphine)
  - can occur independently of phase I reactions
Factors Affecting Drug Biotransformation
- genetic polymorphisms of metabolizing enzymes
  - individual genotypes may determine rate of drug metabolism (e.g. poor, intermediate, extensive, or ultrarapid metabolizers)
  - may lead to toxicity or ineffectiveness of a drug at a normal dose
    - tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas overactive/duplicated alleles impart “ultrarapid metabolizer” phenotype)
    - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to greater effect and lower dose requirements)
- enzyme inhibition may sometimes be due to other drugs
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin [CYP3A4 inhibitor] can predispose patients to simvastatin toxicity [metabolized by CYP3A4])
- enzyme induction
  - certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCPs) by inducing the CYP system
- liver dysfunction (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver’s reserve capacity
- renal disease often results in decreased drug clearance
- extremes of age (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly
- nutrition: insufficient protein and fatty acid intake decreases CYP biotransformation, and vitamin/mineral deficiencies may also impact other metabolizing enzymes
- alcohol: while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase risk of hepatocellular damage from acetaminophen by increasing the generation of acetaminophen’s toxic metabolite
- smoking can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, antipsychotic)

Elimination
- definition: removal of drug from the body

Routes of Drug Elimination
- kidney (main organ of elimination): two mechanisms
  1. glomerular filtration
     - a passive process, so that only the free drug fraction can be eliminated
     - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
  2. tubular secretion
     - an active process that is saturable allowing both protein-bound and free drug fractions to be excreted
     - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
     - drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can reduce the excretion of penicillin)
- tubular reabsorption: drugs can be passively reabsorbed back to the systemic circulation, countering elimination mechanisms
- renal function (assessed using serum Cr levels) decreases with age and is affected by many disease states such as diabetes
- stool: some drugs and metabolites are actively excreted in the bile or directly into the GI tract
  - enterohepatic reabsorption counteracts stool elimination, and can prolong the drug’s duration in the body
  - some glucuronic acid conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed
- lungs: elimination of anesthetic gases and vapours by exhalation
- saliva: saliva concentrations of some drugs parallel their plasma levels (e.g. rifampin)
Pharmacokinetic Calculation

- **definition:** the quantitative description of the rates of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on a concentration vs. time graph

**Time Course of Drug Action**
- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a log10 concentration to allow for easier mathematical calculations
- drugs such as warfarin can exhibit hysteresis (for a single drug concentration, there may be two different response levels)

**Half-Life**
- **definition:** time taken for the serum drug level to fall 50% during elimination
- drugs with first order kinetics require five half-lives to reach steady state with repeated dosing or for complete drug elimination once dosing is stopped

<table>
<thead>
<tr>
<th># of Half-Lives</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>3.3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>% of Steady State Concentration</td>
<td>50</td>
<td>75</td>
<td>87.5</td>
<td>90</td>
<td>93.8</td>
<td>96.9</td>
</tr>
</tbody>
</table>

**Steady State**
- drug concentration remains constant when amount of drug entering the system is eliminated from the system
- drug levels in therapeutic drug monitoring are of greatest utility when the steady state has been reached
- special situations
  - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
  - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, insulin, unfractionated heparin)

**Clearance**
- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
- **Cl** = rate of elimination of drug/plasma drug concentration
- must consider Cl from a specific part of the body and total body Cl

**Elimination Kinetics**
- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the Cl decreases
  - becomes linear relationship when plotted on a log (concentration) vs. time graph
- zero-order kinetics (less common, associated with overdose, e.g. alcohol)
  - drug is eliminated at a constant rate regardless of concentration; concept of half-life does not apply
  - the concentration axis is converted to a log (concentration) to allow for easier mathematical calculations

**Table 2. Loading vs. Maintenance Dosing**

<table>
<thead>
<tr>
<th>Loading Dose</th>
<th>Maintenance Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use when you need an IMMEDIATE effect</td>
<td>After a loading dose OR beginning with maintenance doses</td>
</tr>
<tr>
<td>Often parenteral medication</td>
<td>Steady-state levels achieved after —5 half-lives</td>
</tr>
<tr>
<td>Rationale: give large dose of medication to &quot;fill up&quot; the volume of distribution</td>
<td>Can be given as either a continuous infusion (relatively rare, short half-life drug) OR much more commonly as intermittent doses</td>
</tr>
</tbody>
</table>

---

**Rationale:** give large dose of medication to “fill up” the volume of distribution

**Use when you need an IMMEDIATE effect**

For most drugs it takes 5 half-lives to reach steady state with repeated dosing or to eliminate a drug once dosing is stopped.

**Figure 2. Time course of drug action**

For most drugs it takes 5 half-lives to reach steady state with repeated dosing or to eliminate a drug once dosing is stopped.

**Figure 3. Steady state of a drug displaying first-order kinetics**

In first order kinetics (solid line), a constant fraction of the drug is eliminated per unit time; in zero-order kinetics (dashed line), a constant amount of the drug is eliminated per unit time.
Pharmacodynamics

- study of "what the drug does to the body"

### Dose-Response Relationship

- graded dose-response relationships: relates dose to intensity of effect

#### Efficacy

- the maximum biological response produced by a drug
- measured by Emax (the maximal response that a drug can elicit in a RCT or under optimal circumstances)

#### Potency

- measured by EC50 (the concentration of a drug needed to produce 50% of Emax)
- a drug that reaches its EC50 at a lower dose is more potent

<table>
<thead>
<tr>
<th>Potency: A &gt; B &gt; C (both B and C are less potent than A)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Efficacy: A = C &gt; B</td>
</tr>
</tbody>
</table>

![Figure 5. Log(dose)-response curve illustrating efficacy and potency](image)

**Effects of Drugs on Receptors**

#### Agonists

- drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  - affinity: the ability of the agonist to bind to the receptor (e.g. the β2-agonist salbutamol has greater affinity for β2-receptors than β1-receptors)
  - efficacy: the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to β2-receptors results in smooth muscle relaxation)
  - full agonists: can elicit a maximal effect at a receptor
  - partial agonists: can only elicit a partial effect, no matter the concentration at the receptor (i.e. reduced efficacy compared to full agonists)

#### Antagonists

- drugs that block the action of an agonist or of an endogenous ligand
- chemical antagonism: direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
- functional antagonism: two agonists that act independently at different receptors and have opposite physiological effects (e.g. acetylcholine at the muscarinic receptor compared to epinephrine at the adrenergic receptor)

#### Reversible and irreversible competitive antagonism

- drugs that exert no direct effect upon binding to a given receptor
- reversible competitive antagonists reversibly bind to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)
- irreversible antagonists form a covalent bond with the receptor, thus irreversibly blocking substrates from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)

#### Non-competitive antagonism

- antagonist binds to an alternate site near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)

**Efficacy vs. Potency**

- Efficacy measures the maximal effect of a drug
- Potency measures the concentration of a drug needed to produce a certain effect

![Figure 6. The log(dose)-response curve for competitive reversible antagonism](image)

![Figure 7. The log(dose)-response curve for irreversible antagonism](image)
Effectiveness and Safety

Effectiveness
- **ED$_{50}$** (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

Safety
- **LD$_{50}$** (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- **TD$_{50}$** (toxic dose): the dose needed to cause a harmful effect in 50% of a test population of subjects

Therapeutic Indices

**Therapeutic Index:** TD$_{50}$/ED$_{50}$
- reflects the "margin of safety" for a drug – the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer a drug (e.g. warfarin has a narrow TI and requires drug monitoring)
- factors that can change the TI
  - presence of interacting drugs
  - changes in drug ADME

**Certain Safety Factor:** TD$_{1}$/ED$_{99}$
- >1 translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population
Therapeutic Drug Monitoring

- **Definition**: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance)
  - Serum drug samples are usually taken when the drug has reached steady state (after approximately 5 half-lives)
  - TDM is often used for drugs that have: narrow TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and wide inter-patient PK variability

Adverse Drug Reactions

Table 3. Characteristics of Type A-E Adverse Drug Reactions

<table>
<thead>
<tr>
<th>Classification</th>
<th>Definition</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A (Augmented)</strong></td>
<td>Dose related</td>
<td>Predictable extension of drug’s pharmacologic effect (e.g. β-blockers causing bradycardia) &gt; 80% of all ADRs</td>
</tr>
<tr>
<td><strong>B (Bizarre)</strong></td>
<td>Non-dose related</td>
<td>Reactions unrelated to the known pharmacological actions of the drug Examples include: drug hypersensitivity syndromes, immunologic reactions (penicillin hypersensitivity), and idiosyncratic reactions (malignant hyperthermia)</td>
</tr>
<tr>
<td><strong>C (Chronic)</strong></td>
<td>Dose and time related</td>
<td>Related to cumulative doses Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates)</td>
</tr>
<tr>
<td><strong>D (Delayed)</strong></td>
<td>Time related</td>
<td>Occurs some time after use of drug (e.g. carcinogen) May also be dose-related</td>
</tr>
<tr>
<td><strong>E (End of use)</strong></td>
<td>Withdrawal</td>
<td>Occurs after cessation of drug use (e.g. opiate withdrawal)</td>
</tr>
</tbody>
</table>

Approach to Suspected Adverse Drug Reactions

- History and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again)
- Differentiate between drug therapy vs. disease pathophysiology
- Treatment: stop the drug, supportive care, symptomatic relief
- Resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-888-268-9017) if overdose or poisoning suspected; check with Motherisk (www.motherisk.org) in cases involving pregnant or breastfeeding women
- Report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
  - Canadian Adverse Drug Reaction Monitoring Program available for online reporting

Examples of drugs whose levels need to be monitored include warfarin (via INR levels), digoxin, lithium, anti-epileptics (e.g. phenytoin, carbamazepine)

</tbody>
</table>
Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
- possible causes of individual variability in drug response include problems with:
  - intake: patient adherence
  - PK
    - absorption: vomiting, diarrhea, or steatorrhea; first pass effect increased due to enzyme induction or decreased due to liver disease
    - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones)
    - distribution: very high or low percentage body fat; intact or disrupted BBB; patient is elderly or a neonate, or has liver dysfunction
    - biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism); kidney or liver dysfunction
  - PD: genetic variability in drug response (e.g. immune-mediated reactions); diseases that affect drug PD; drug tolerance or cross-tolerance

Drug Interactions

- concomitant prescriptions: one drug alters the effect of another by changing its PK and/or PD
- PK interactions involve changes in drug concentration
  - absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut mucosal function
  - biotransformation: alterations in drug metabolizing enzymes
  - excretion: alterations in renal elimination
- PD interactions are due to two drugs that exert similar effects (additive) or opposing effects (subtractive)
- drug interactions can also involve herbal medications (e.g. St. John's wort) and food (e.g. grapefruit)

Autonomic Pharmacology

![Autonomic Pharmacology Diagram](image)

- most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see Neurology, N8)
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to cholinergic receptors, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which principally include β1, β2, α1, and α2
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
- acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer's disease
- NE action is terminated by reuptake at the presynaptic membrane, diffusion from the synaptic cleft, and degradation at monoamine oxidase (MAO) and catechol-O-methyl transferase (COMT)

Parasympathetic Nervous System

- blood vessels, adrenals, sweat glands, spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4 and connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ
- post-ganglionic fibres connect with effector tissues via:
  - M: muscarinic receptors located in the CNS
  - M: muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium
### Sympathetic Nervous System

- sympathetic pre-ganglionic fibres originate in the spinal cord at spinal levels T1-L2/L3
- pre-ganglionic fibres connect with post-ganglionic fibres via nicotinic receptors located in one of two groups of ganglia:
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via:
  - β1 receptors in cardiac tissue
  - β2 receptors in smooth muscle of bronchi and GI tract
  - α1 receptors in vascular smooth muscle
  - α2 receptors in vascular smooth muscle
  - M3 muscarinic receptors located in sweat glands

### Introduction to Skin

#### Skin Anatomy

![Figure 1. Histologic layers of the skin. Epidermal layer is detailed in A](image)

**Skin**
- divided anatomically into epidermis, dermis, and subcutaneous tissue
- **epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
  - stratum basale (germinativum): mitotic figures that give rise to keratinocytes
  - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
  - stratum granulosum: flat cells containing basophilic granules which characterize skin
  - stratum lucidum: transparent layers of packed dead cells
  - stratum corneum: flat scales of the water-resistant protein keratin
- cells of the epidermis
  - keratinocytes: located in all layers of the epidermis, except the stratum corneum; connected to each other by desmosomes
  - melanocytes: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produce melanosomes containing melanin, which are transferred to keratinocytes
  - Langerhans cells: dendritic cells which are important for immune surveillance
  - Merkel cells: located in the basal layer; involved in touch sensation
- **dermis**: comprised of connective tissue divided into two regions
  - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
  - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
- cells of dermis
  - fibroblasts: produces collagen, elastic, and ground substance
  - mast cells: releases histamines which mediate type I hypersensitivity
  - other components of dermis include: blood vessels, nerves, pilosebaceous units, and sweat glands
- **subcutaneous tissue** (hypodermis)
  - consists primarily of adipose cells, larger calibre vessels, nerves and fascia
Epidermal Appendages
- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

Cutaneous Glands
- sebaceous gland: part of pilosebaceous unit, produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- apocrine sweat gland: apocrine duct empties into hair follicle above sebaceous gland
  - found in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- eccrine sweat gland: not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

Skin Function
- protection
  - due to continuous recycling and avascularity of epidermis
  - barrier to UV radiation (melanin), mechanical/chemical insults (sensory/mechano receptors), pathogens (immune cells), and dehydration (lipid rich barrier)
- thermal regulation
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- sensation
  - touch, pain, and temperature sensation
- metabolic function
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

Definitions

Primary Morphological Lesions
Definition
- an initial lesion that has not been altered by trauma or manipulation, and has not regressed

Table 1. Types of Primary Morphological Lesions
<table>
<thead>
<tr>
<th>Profile</th>
<th>&lt;1 cm Diameter</th>
<th>≥1 cm Diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flat lesion</td>
<td>Macule (e.g. freckle)</td>
<td>Patch (e.g. vitiligo)</td>
</tr>
<tr>
<td>Raised superficial lesion</td>
<td>Papule (e.g. wart)</td>
<td>Plaque (e.g. psoriasis)</td>
</tr>
<tr>
<td>Deep palpable (dermal or subcutaneous)</td>
<td>Nodule (e.g. dermatofibroma)</td>
<td>Tumour (e.g. lipoma)</td>
</tr>
<tr>
<td>Elevated fluid-filled lesions</td>
<td>Vesicle (e.g. HSV)</td>
<td>Bulla (e.g. bullous pemphigoid)</td>
</tr>
</tbody>
</table>

Secondary Morphological Lesions
Definition
- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- crust: dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- scale: excess keratin (e.g. seborrheic dermatitis)
- lichenification: thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- fissure: a linear slit-like cleavage of the skin
- excoriation: a scratch mark
- erosion: a disruption of the skin involving the epidermis alone; heals without scarring
- ulcer: a disruption of the skin that extends into the dermis or deeper; may heal with scarring
- xerosis: pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes (xerostomia)
- atrophy: histological decrease in size or number of cells or tissues, resulting in thinning or depression of the skin
Other Morphological Lesions

- **cyst**: an epithelial-lined collection containing semi-solid or fluid material
- **pustule**: an elevated lesion containing purulent fluid (white, grey, yellow, green)
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheal**: a special form of papule or plaque that is transient (<24 h) and blanchable often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedone**: a special collection of sebum and keratin
  - open comedo (blackhead)
  - closed comedo (not a pustule; rather a minute dome-shaped, skin-coloured papule)
- **petechiae**: pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechia, 3 mm-1 cm in size
- **ecchymosis**: larger than purpura, >1 cm in size (i.e. a “bruise”)
- **telangiectasia**: dilated superficial blood vessels; often blanchable, reticulated, and of small calibre, can be associated with benign or malignant entities

Patterns and Distribution

- **acral**: relating to the hands and feet (e.g. perniosis, secondary syphilis)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a “drop-like” pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: i.e. isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo)
- **morbilliform**: literally means “measles-like”, an eruption composed of macules and papules with truncal predominance
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: small lesions scattered around the periphery of a larger lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. erythema multiforme)
- **other descriptive terms**: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)
### Differential Diagnoses of Common Presentations

#### Cysts

##### Table 3. Cysts

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Clinical Course</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Epidermal Cyst</td>
<td>Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic</td>
<td>Most common cutaneous cyst in youth – middle age</td>
<td>Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Increase in size and number over time, especially in pregnancy</td>
<td>Excise completely before it becomes infected</td>
</tr>
<tr>
<td>Pilar Cyst (Trichilemmal)</td>
<td>Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma, often familial</td>
<td>2nd most common cutaneous cyst F&gt;M</td>
<td>Rupture causes pain and inflammation</td>
<td>Excision</td>
</tr>
<tr>
<td>Dermoid Cyst</td>
<td>Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin</td>
<td>Rare</td>
<td>If nasal midline, risk of extension into CNS</td>
<td>Excision</td>
</tr>
<tr>
<td>Ganglion Cyst</td>
<td>Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthrits</td>
<td>Older age</td>
<td>Stable</td>
<td>Incision and expression of contents Laser ablation and electrodesiccation</td>
</tr>
<tr>
<td>Milium</td>
<td>Small epidermoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures</td>
<td>Any age 40-50% of infants</td>
<td>In newborns, spontaneously resolves in first 4 wk of life</td>
<td>Incision and expression of contents Laser ablation and electrodesiccation Multiples facial milia respond to topical retinoid therapy</td>
</tr>
</tbody>
</table>
**Fibrous Lesions**

**DERMATOFIBROMA**

**Clinical Presentation**
- button-like, firm dermal papule or nodule, skin-coloured to red-brown colouring
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign (Fitzpatrick’s sign): lateral compression causes dimpling of the lesion

**Pathophysiology**
- benign tumour due to fibroblast proliferation in the dermis

**Etiology**
- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibromata can be associated with SLE

**Epidemiology**
- adults, F>M

**Differential Diagnosis**
- dermatofibrosarcoma protuberans, malignant melanoma, Kaposi’s sarcoma, blue nevus

**Investigations**
- biopsy if diagnosis is uncertain

**Management**
- no treatment required
- excision or cryosurgery if bothersome

**Skin Tags**

**Clinical Presentation**
- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

**Pathophysiology**
- benign outgrowth of skin

**Epidemiology**
- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

**Differential Diagnosis**
- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC)

**Management**
- excision, electrodessication, cryosurgery

**Hyperkeratotic Lesions**

**SEBORRHEIC KERATOSIS**

**Clinical Presentation**
- known as ‘wisdom spots,’ ‘age spots,’ or ‘barnacles of life’
- well-demarcated waxy papule/plaque with classic “stuck on” appearance
- rarely pruritic
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

**Pathophysiology**
- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

**Epidemiology**
- unusual <30 yr old
- M>F
- autosomal dominant inheritance
- Leser-Trelat: sudden appearance of SK that can be associated with malignancy, commonly gastric adenocarcinomas
**Differential Diagnosis**
- malignant melanoma (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

**Investigations**
- biopsy only if diagnosis uncertain

**Management**
- none required, for cosmetic purposes only
- cryotherapy, curettage

**ACTINIC KERATOSIS (SOLAR KERATOSIS)**
- see Pre-Malignant Skin Conditions, D33

**KERATOACANTHOMA**
- see Malignant Skin Tumours, D35

**CORNS (HELOMATA)**

**Clinical Presentation**
- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

**Pathophysiology**
- localized hyperkeratosis induced by pressure on hands and feet

**Epidemiology**
- F>M, can be caused by chronic microtrauma

**Differential Diagnosis**
- tinea pedis, plantar warts

**Management**
- relieve pressure with padding or alternate footwear, orthotics
- paring, curettage

---

**Keloids**

**Clinical Presentation**
- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for years with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area, angle of mandible

**Pathophysiology**
- excessive deposition of randomly organized collagen fibres following trauma to skin

**Epidemiology**
- most common in black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

**Management**
- intralesional corticosteroid injections
- cryotherapy
- silicone compression
Pigmented Lesions

CONGENITAL NEVOMELANOCYTIC NEVI (CNMN)

Clinical Presentation
- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
- classified by size: small (<1.5 cm), medium (M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2 >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
- may be surrounded by smaller satellite nevi

Pathophysiology
- nevomelanocytes in epidermis (clusters) and dermis (strands)

Epidemiology
- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNMN (melanocytes in the central nervous system)

Management
- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

OTHER CONGENITAL PIGMENTED LESIONS

Table 4. Comparison of Other Congenital Pigmented Lesions

<table>
<thead>
<tr>
<th></th>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Differential Diagnosis</th>
<th>Clinical Course and Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Café-au-lait macule</td>
<td>Flat light brown lesions with smooth or jagged borders</td>
<td>Areas of increased melanogenesis</td>
<td>6 or more is suggestive of neurofibromatosis type I. Also associated with McCune-Albright syndrome</td>
<td>Flat congenital melanocytic nevus, speckled lentiginous nevus</td>
<td>Enlarge in proportion to the child. Laser can be used to treat for cosmesis</td>
</tr>
<tr>
<td>Speckled lentiginous nevus (nevus spilus)</td>
<td>Brown pigmented macular background (café-au-lait macule-like) with dark macular or papular speckles</td>
<td>Increased melanocyte concentration</td>
<td>Risk of melanoma similar to that of a CNMN of the same size</td>
<td>Café-au-lait macule, agminated lentigines, Becker’s nevus</td>
<td>Usually the light macular background is present at birth and speckles develop over time. Management is similar to that of CNMNs</td>
</tr>
<tr>
<td>Dermal Melanocytosis (historically known as Mongolian Spot)</td>
<td>Congenital grey-blue solitary or grouped macules commonly on lumbosacral area</td>
<td>Ectopic melanocytes in dermis</td>
<td>99% occurs in Asian and Aboriginal infants</td>
<td>Echymosis</td>
<td>Usually fades in early childhood but may persist into adulthood</td>
</tr>
</tbody>
</table>

ACQUIRED NEVOMELANOCYTIC NEVI

Clinical Presentation
- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- 3 stages of evolution: junctional NMN, compound NMN, and dermal NMN

Table 5. Evolution of Acquired Nevomelanocytic Nevi

<table>
<thead>
<tr>
<th>Type</th>
<th>Age of Onset</th>
<th>Clinical Presentation</th>
<th>Histology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Junctional</td>
<td>Childhood</td>
<td>Flat, irregularly bordered, uniformly tan-dark brown, sharply demarcated smooth macule</td>
<td>Melanocytes at dermal-epidermal junction above basement membrane</td>
</tr>
<tr>
<td>Compound</td>
<td>Any age</td>
<td>Dome-shaped, regular, round, tan-dark brown papule</td>
<td>Melanocytes at dermal-epidermal junction; migration into dermis</td>
</tr>
<tr>
<td>Dermal</td>
<td>Adults</td>
<td>Soft, dome-shaped, skin-coloured to tan’ brown papules or nodules, often with telangiectasia</td>
<td>Melanocytes exclusively in dermis</td>
</tr>
</tbody>
</table>

Other Nevi
- Halo nevus: often a typical appearing nevus surrounded by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- Blue nevus: round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted
Management

- new or changing pigmented lesions should be evaluated for atypical features which could indicate a melanoma
- excisional biopsy can be considered if the lesion demonstrates asymmetry, varied colours, irregular borders, pruritus or persistent bleeding

OTHER ACQUIRED PIGMENTED LESIONS

Table 6. Comparison of Other Acquired Pigmented Lesions

<table>
<thead>
<tr>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Differential Diagnosis</th>
<th>Clinical Course and Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atypical nevus (Dysplastic Nevus)</td>
<td>Variegated macule/papule with irregular distinct melanocytes in the basal layer</td>
<td>Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus</td>
<td>&gt;5 atypical nevi increases risk for melanoma; Numerous dysplastic nevi may be part of Familial Atypical Mole and Melanoma syndrome</td>
<td>Follow with colour photographs for changes; Excisional biopsy if lesion changing or highly atypical</td>
</tr>
<tr>
<td>Ephelides (Freckles)</td>
<td>Small (&lt;5 mm) well-demarcated light brown macules</td>
<td>Increased melanin within basal layer keratinocytes secondary to sun exposure</td>
<td>Skin phototypes III-IV</td>
<td>Multiply and darken with sun exposure, fade in winter; No treatment required; Sunscreen may prevent the appearance of new freckles</td>
</tr>
<tr>
<td>Solar Lentigo (Liver Spot)</td>
<td>Well-demarcated brown/black irregular macules</td>
<td>Benign melanocytic proliferation in dermal-epidermal junction due to chronic sun exposure</td>
<td>Most common in Caucasians; &gt;40 yr; Skin phototypes III-IV</td>
<td>Lentigo maligna; seborrheic keratosis, pigmented solar keratosis; Laser therapy; shave excisions, cryotherapy</td>
</tr>
<tr>
<td>Becker’s Nevus</td>
<td>Hairy, light brown macule/patch with a papular verrucous surface</td>
<td>Pigmented hamartoma with increased melanin in basal cells</td>
<td>M&gt;F; Often becomes noticeable at puberty</td>
<td>Hairy congenital melanocytic nevus; Hair growth follows onset of pigmentation; Cosmetic management (usually too large to remove)</td>
</tr>
<tr>
<td>Melasma</td>
<td>Dark, usually symmetrical, skin discoloration on sun-exposed areas of face (forehead, upper lip, cheeks, chin)</td>
<td>Increase in number and activity of melanocytes associated with estrogen and progesterone</td>
<td>F&gt;M; Common in pregnancy and women taking DCP or HRT; Risk factors: sun exposure, dark skin tone; Can occur with mild endocrine disturbances, antiepileptic medications, and other photosensitizing drugs</td>
<td>Post-inflamatory hyperpigmentation, Reit melanosis; Often fades over several months after stopping hormone treatment or delivering baby; Treatment: hydroquinone, azelaic acid, retinoic acid, topical steroid, combination creams, destructive modalities (chemical peels, laser treatment), camouflage make-up, sunscreen, sun avoidance</td>
</tr>
</tbody>
</table>

Vascular Lesions

<tr>
<td>M:F</td>
<td>1:3-5:1</td>
</tr>
<tr>
<td>Natural History</td>
<td>Phases: Proliferating, Involuting, Involved; Proportionate growth (can expand)</td>
</tr>
</tbody>
</table>

HEMANGIOMAS

Clinical Presentation

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a “bag of worms” when palpated

Pathophysiology

- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion
## Vascular Malformations

### Table 8. Vascular Tumours

<table>
<thead>
<tr>
<th>Type</th>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Epidemiology</th>
<th>Clinical Course</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hemangioma of infancy</td>
<td>Hot, firm red to blue plaques or tumours</td>
<td>Benign vascular proliferation of endothelial lining</td>
<td>Appears shortly after birth; rarely may be congenital</td>
<td>Appears shortly after birth, increases in size over months, then regresses</td>
<td>10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>50% of lesions resolve spontaneously by 5 yr</td>
<td>Consider treatment if not gone by school age; propranolol; systemic corticosteroids; laser treatment; surgery</td>
</tr>
<tr>
<td>Spider Angioma (Campbell De Morgan Spot)</td>
<td>Central red arteriole with slender branches, faintly pulsatile, blanchable</td>
<td>Can be associated with hyperestrogenic state (e.g. in hepatocellular disease, pregnancy, OCP) but often is not</td>
<td>Increase in number over time</td>
<td>Reassurance</td>
<td>Electrodesiccation or laser surgery if patient wishes</td>
</tr>
<tr>
<td>Cherry Angioma (Campbell De Morgan Spot)</td>
<td>Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm Site: trunk Less friable compared to pyogenic granulomas</td>
<td>Benign vascular neoplasm</td>
<td>&gt;30 yr old</td>
<td>Lesions do not fade in time Lesions bleed infrequently</td>
<td>Usually no treatment needed Laser or electrocautery for small lesions Excision of large lesions if necessary</td>
</tr>
<tr>
<td>Pyogenic Granuloma</td>
<td>Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes DDx: glomus tumour, nodular MM, SCL, nodular BCC</td>
<td>Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia</td>
<td>&lt;30 yr old</td>
<td>Surgical excision with histologic examination Electrocautery; laser; cryotherapy</td>
<td></td>
</tr>
</tbody>
</table>

### Table 9. Vascular Malformations

<table>
<thead>
<tr>
<th>Type</th>
<th>Clinical Presentation</th>
<th>Pathophysiology</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nevus Flammeus (Port-wine stain)</td>
<td>Red to blue macule present at birth that follows a dermalatal distribution, rarely crosses midline Most common site: nape of neck Never spontaneously regresses but grows in proportion to the child</td>
<td>Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)</td>
<td>Laser or make-up</td>
</tr>
<tr>
<td>Nevus Simplex (salmon patch)</td>
<td>Pink-red irregular patches Midline macule on glabella known as “Angel Kiss”; on nuchal region known as “Stork Bites” Present in 1/3 of newborns Majority regress spontaneously</td>
<td>Congenital dilation of dermal capillaries</td>
<td>No treatment required</td>
</tr>
</tbody>
</table>

### Lipoma

**Clinical Presentation**
- Single or multiple non-tender subcutaneous tumours that are soft and mobile
- Occurs most frequently on the trunk, and extremities but can be anywhere on the body

**Pathophysiology**
- Adipocytes enclosed in a fibrous capsule

**Epidemiology**
- Often solitary or few in number; if multiple can be associated with rare syndromes

**Differential Diagnosis**
- Angiolipoma, liposarcoma

**Investigations**
- Biopsy only if atypical features (painful, rapid growth, firm)

**Management**
- Reassurance
- Excision or liposuction only if desired for cosmetic purposes
## Acneiform Eruptions

### Acne Vulgaris/Common Acne

#### Clinical Presentation
- A common inflammatory pilosebaceous disease categorized with respect to severity
  - Type I: comedonal, sparse, no scarring
  - Type II: comedonal, papular, moderate ± little scarring
  - Type III: comedonal, papular, and pustular, with scarring
  - Type IV: nodulocystic acne, risk of severe scarring
- Sites of predilection: face, neck, upper chest, and back

#### Pathophysiology
- Hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
- Androgens promote excess sebum production
- *Propionibacterium* acnes metabolize sebum to free fatty acids and produces pro-inflammatory mediators

#### Epidemiology
- Age of onset in puberty (10-17 yr in females, 14-19 yr in males)
- In prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- More severe in males than in females
- Incidence decreases in adulthood
- Genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

#### Differential Diagnosis
- Folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

### Table 10. Management of Acne

<td></td>
<td></td>
</tr>
<tr>
<td>Isotretinoin</td>
<td>Accutane®, Clanus®, Epuris®</td>
<td>See Table 27 for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and β-hCG before treatment May transiently exacerbate acne before patient sees improvement Refractory cases may require multiple courses of isotretinoin</td>
</tr>
</tbody>
</table>

### Acne Myths Debunked
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

### Acne Exacerbating Factors
- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

### Intrallesional Injections
- A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

### Isotretinoin and Pregnancy
- Use of isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Ideally, patients should use 2 forms of contraception while on isotretinoin
**Perioral Dermatitis**

**Clinical Presentation**
- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal, and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

**Epidemiology**
- 15-40 yr old, occasionally in younger children
- predominantly females

**Differential Diagnosis**
- contact dermatitis, rosacea, acne vulgaris

**Management**
- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)
- occasional use of a non-steroidal anti-inflammatory cream (i.e. tacrolimus or pimecrolimus)

**Rosacea**

**Clinical Presentation**
- dome-shaped inflammatory papules ± pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, caffeine, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharoconjunctivitis, keratitis, iritis

**Pathophysiology**
- unknown

**Epidemiology**
- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

**Differential Diagnosis**
- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

**Management**
- trigger avoidance and daily sunscreen use for long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electro surgery, cryotherapy, laser therapy (CO₂, argon, Nd:YAG)

**Important Controversies Associated with Isotretinoin Therapy for Acne**

- **Study:** Review on isotretinoin and (1) depression and suicide, (2) inflammatory bowel disease (IBD), (3) pregnancy prevention programs.
- **Conclusions**
  1. The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin.
  2. There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

**Guidelines for the Diagnosis of Rosacea**

- Presence of one or more of the following primary features:
  - Flushing (transient erythema)
  - Nontransient erythema
  - Papules and pustules
  - Telangiectasia
- May include one or more of the following secondary features:
  - Burning or stinging
  - Dry appearance
  - Edema
  - Phymatous changes
  - Ocular manifestations
  - Peripheral location
Dermatitis (Eczema)

Definition
- inflammation of the skin

Clinical Presentation
- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting, excoriations
- chronic dermatitis: lichenification, xerosis, fissuring

Asteatotic Dermatitis

Clinical Presentation
- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. "winter itch") but starts in the fall
- shins predominate, looks like a "dried river bed"

Management
- skin rehydration with moisturizing routine ± mild corticosteroid creams

Atopic Dermatitis

Clinical Presentation
- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, "chicken skin"), xerosis, occupational hand dryness

Epidemiology
- frequently affects infants, children, and young adults
- almost 15% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever), anaphylaxis, eosinophilia
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- the earlier the onset, the more severe and persistent the disease
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

Pathophysiology
- a T-cell driven process with epidermal barrier dysfunction

Investigations
- clinical diagnosis
- consider: skin biopsy, immunoglobulin serum levels (often elevated serum IgE level), patch testing, and skin prick tests

Management
- goal: reduce signs and symptoms, prevent or reduce recurrences/flare
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early and treatment plan individualized
- avoid triggers of AD
- non-pharmacologic therapy
  - moisturizers
    - apply liberally and reapply frequently with goal of minimizing xerosis
    - include in treatment of mild to severe disease as well as in maintenance therapy
  - bathing practices
    - bathe in plain warm water for a short period of time once daily followed by lightly but not completely drying the skin with a towel; immediately apply topical agents or moisturizers after this
    - use fragrance-free hypoallergenic non-soap cleansers
- pharmacologic therapy
  - topical corticosteroids
    - effective in reducing acute and chronic symptoms as well as prevention of flares
    - choice of steroid potency depends on age, body site, short vs. long-term use
    - apply 1 adult fingertip unit (0.5 g) to an area the size of 2 adult palms bid for acute flares, and 1-2x/wk for maintenance therapy
  - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneiform eruption are all very rarely seen

Triggers for Atopic Dermatitis
- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental allergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. S. aureus)
- Stress
Contact Dermatitis

Clinical Presentation
- cutaneous inflammation caused by an external agent(s)

Table 12. Contact Dermatitis

<table>
<thead>
<tr>
<th>Mechanism of Reaction</th>
<th>Irritant Contact Dermatitis</th>
<th>Allergic Contact Dermatitis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toxic injury to skin; non-immune mechanism</td>
<td>Erythema, dryness, fine scale, burning</td>
<td>Cell-mediated delayed (Type IV) hypersensitivity reaction (see Rheumatology, RH2)</td>
</tr>
<tr>
<td>Visible or invisible</td>
<td>Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure)</td>
<td>Erythema with a papulovesicular eruption, swelling, pruritus</td>
</tr>
<tr>
<td>Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Frequency | Majority; will occur in anyone given sufficient concentration of irritants | Minority; patient acquires susceptibility to allergen that persists indefinitely |
| Distribution | Hands are the most common site | Areas exposed to allergen |
| Examples | Soaps, weak alkali, detergents, organic solvents, alcohol, oils | Many allergens are irritants, so may coincide with irritant dermatitis |
| Management | Avoidance of irritants, wet compressors with Burow’s solution, barrier moisturizers | Patch testing to determine specific allergen, avoid allergen and its cross-reactants |
| | Topical/oral steroids | Steroid cream (e.g. hydrocortisone 1%, betamethasone valerate 0.05% or 0.1%, cream; bid) |
| | | Systemic steroids pm (prednisone 1 mg/kg, taper over 2 wk) |
**Dyshidrotic Dermatitis**

**Clinical Presentation**
- "tapioca pudding" papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infections common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

**Pathophysiology**
- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate flares

**Management**
- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic:
  - prednisone in severe cases
  - antibiotics for secondary *S. aureus* infection

**Nummular Dermatitis**

**Clinical Presentation**
- annular, coin-shaped, pruritic, dry, scaly, erythematous plaques, can become lichenified
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

**Pathophysiology**
- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

**Management**
- moisturization
- mid to high potency corticosteroid ointment bid

**Seborrheic Dermatitis**

**Clinical Presentation**
- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: "cradle cap"
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

**Pathophysiology**
- possible etiologic association with *Malassezia* spp. (yeast)

**Epidemiology**
- common in infants and adolescents
- increased incidence and severity in immunocompromised patients
- in adults, can cause dandruff (pityriasis siccata)

**Management**
- face: ketoconazole (Nizoral®) cream daily or bid + mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoothe FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Stieprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)
**Stasis Dermatitis**

**Clinical Presentation**
- erythematous, scaly, pruritic plaques in lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages
- usually bilateral, accompanied by swelling, oozing, crusting, may have accompanying varicosities

**Pathophysiology**
- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

**Investigations**
- Doppler and colour-coded Duplex sonography if suspicious for DVT
- culture for MRSA if there is crusting

**Management**
- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

**Complications**
- ulceration (common at medial malleolus), secondary bacterial infections

**Lichen Simplex Chronicus**

**Clinical Presentation**
- well-defined plaque(s) of lichenified skin with increased skin markings ± excoriations
- common sites: neck, scalp, lower extremities, urogenital area
- often seen in patients with atopy

**Pathophysiology**
- skin hyperexcitable to itch, continued rubbing/scratching of skin results
- eventually lichenification occurs

**Investigations**
- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, bilirubin, renal and thyroid function tests
- CXR if lymphoma suspected

**Management**
- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)

**Papulosquamous Diseases**

**Lichen Planus**

**Clinical Presentation**
- acute or chronic inflammation of mucous membranes or skin, especially on flexural surfaces
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules
- common sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis
- spontaneously resolves but may last for weeks, months or years (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon

**Pathophysiology**
- autoimmune, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

**Epidemiology**
- 1%
- 30-60 yr old, F>M
Investigations
• biopsy
• hepatitis C serology if patient has risk factors

Management
• topical or intralesional corticosteroids
• short courses of oral prednisone (rarely)
• phototherapy for generalized or resistant cases
• oral retinoids for erosive lichen planus in mouth
• systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine)

Pityriasis Rosea

Clinical Presentation
• acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
• long axis of lesions follows skin tension lines (i.e. Langer's Lines) parallel to ribs producing “Christmas tree” pattern on back
• varied degree of pruritus
• most start with a “herald” patch which precedes other lesions by 1-2 wk
• common sites: trunk, proximal aspects of arms and legs

Etiology
• suspected HHV-7 or HHV-6 reactivation

Investigations
• none required

Management
• none required; clears spontaneously in 6-12 wk
• symptomatic: topical glucocorticoids if pruritic, cool compresses, emollients

Psoriasis

Classification
1. plaque psoriasis 2. guttate psoriasis 3. erythrodermic psoriasis
4. pustular psoriasis 5. inverse psoriasis

Pathophysiology
• not fully understood, genetic and immunologic factors
• shortened keratinocyte cell cycle leads to Th1- and Th17-mediated inflammatory response

Epidemiology
• 1.5-2%, M=F
• all ages: peaks of onset: 20-30 and 50-60
• polygenic inheritance: 8% with 1 affected parent, 41% with both parents affected
• risk factors: smoking, obesity, alcohol, drugs, infections

Differential Diagnosis
• AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

Investigations
• biopsy (if atypical presentation, rarely needed)

1. PLAQUE PSORIASIS

Clinical Presentation
• chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
• often worse in winter (lack of sun and humidity)
• Auspitz sign: bleeds from minute points when scale is removed
• common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas
Management
• principles of management depends on severity of disease, as defined by BSA affected or less commonly Psoriasis Area and Severity Index (PASI)
  • mild (<5% BSA)
    • topical steroids, topical vitamin D3 analogues, or a combinations of the two are first line
    • topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to have more side effects than first line therapies
    • emollients potentiate the effect of topical therapies
    • phototherapy or systemic treatment may be necessary if the lesions are scattered or if it involves sites that are difficult to treat such as palms, soles, scalp, genitals
  • moderate (5-10% BSA) to severe (>10% BSA)
    • goal of treatment is to attain symptom control that is adequate from patient’s perspective
    • phototherapy if accessible
    • systemic or biological therapy based on patient’s treatment history and comorbidities
    • topical steroid ± topical vitamin D3 analogue as adjunct therapy

</tbody>
</table>

*Can also be used to treat psoriatic arthritis

• biologics under study for treatment of psoriasis: secukinumab, brodalumab, ixekizumab, tildrakizumab, guselkumab
2. GUTTATE PSORIASIS (“DROP-LIKE”)

Clinical Presentation
- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

Management
- UVB phototherapy, sunlight, lubricants
- penicillin V or erythromycin if Group A β-hemolytic Streptococcus on throat culture

3. ERYTHRODERMIC PSORIASIS

Clinical Presentation
- generalized erythema (> 90% of body surface area) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium, β-blockers, NSAIDs, antimalarials, phototoxic reaction, infection

Management
- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition, sun avoidance
- cyclosporine, acitretin, UV, biologics

4. PUSTULAR PSORIASIS

Clinical Presentation
- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized to palms/soles
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy

Management
- methotrexate, cyclosporine, acitretin, biologics

5. INVERSE PSORIASIS

Clinical Presentation
- erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

Management
- low potency topical corticosteroids
- topical vitamin D derivatives such as calcipotriene or calcitriol
- topical calcineurin inhibitors such as tacrolimus or pimecrolimus

6. PSORIATIC ARTHRITIS
- 5-30% of patients with psoriasis can also be suffering from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see Rheumatology, RH23

Vesiculobullous Diseases

Bullous Pemphigoid

Clinical Presentation
- chronic autoimmune bullous eruption characterized by pruritus, pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- can present as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

Pathophysiology
- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

Epidemiology
- mean age of onset: 60-80 yr old, F=M
Investigations
• immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
• anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

Prognosis
• heals without scarring, usually chronic
• rarely fatal

Management
• prednisone 0.5-1 mg/kg/day until clear, then taper ± steroid-sparing agents (e.g. azathioprine, methotrexate)
• topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
• tetracycline ± nicotinamide is effective for some cases
• immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
• IV Ig and plasmapheresis for refractory cases

**Pemphigus Vulgaris**

Clinical Presentation
• autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
• may present with erosions and secondary bacterial infection
• sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
• Nikolsky’s sign: epidermal detachment with shear stress
• Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

Pathophysiology
• IgG against epidermal desmoglein-1 and -3 lead to loss of intercellular adhesion in the epidermis

Epidemiology
• 40-60 yr old, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
• paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

Investigations
• immunofluorescence: shows IgG and C3 deposition intraepidermally
• circulating serum anti-desmoglein IgG antibodies

Prognosis
• lesions heal with hyperpigmentation but do not scar
• may be fatal unless treated with immunosuppressive agents

Management
• prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, methotrexate, gold, cyclophosphamide, cyclosporine, IV Ig, mycophenolate mofetil, rituximab)

**Dermatitis Herpetiformis**

Clinical Presentation
• grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
• lesions grouped, bilaterally symmetrical
• common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

Pathophysiology
• transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
• 90% have HLA B8, DR3, DQWZ
• 90-100% associated with an often subclinical gluten-sensitive enteropathy (i.e. celiac disease)
• 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

Epidemiology
• 20-60 yr old, M:F = 2:1

Investigations
• biopsy
• immunofluorescence shows IgA deposits in perilesional skin
Management
• dapsone (sulfapyridine if contraindicated or poorly tolerated)
• gluten-free diet for life – this can reduce risk of lymphoma

Porphyria Cutanea Tarda

Clinical Presentation
• skin fragility followed by formation of tense vesicles/bullae and erosions on photoexposed skin
• gradual healing to scars, milia
• periorbital violaceous discoloration, diffuse hypermelanosis, facial hypertrichosis
• common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

Pathophysiology
• uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
• can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

Epidemiology
• 30–40 yr old, M>F

Investigations
• urine + 5% HCl shows orange-red fluorescence under Wood’s lamp (UV rays)
• 24 h urine for uroporphyrins (elevated)
• stool contains elevated coproporphyrins
• immunofluorescence shows IgE at dermal-epidermal junctions

Management
• discontinue aggravating substances (alcohol, estrogen therapy)
• phlebotomy to decrease body iron load
• low dose hydroxychloroquine

Drug Eruptions

Exanthematous

Exanthematous Drug Reaction

Clinical Presentation
• morphology: erythematous macules and papules ± scale
• spread: symmetrical, trunk to extremities
• time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

Epidemiology
• most common cutaneous drug reaction; increased in presence of infections
• common causative agents: penicillin, sulfonamides, phenytoin

Management
• weigh risks and benefits of drug discontinuation
• antihistamines, emollients, topical steroids

Drug Induced Hypersensitivity Syndrome (DIHS) / Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS)

Clinical Presentation
• morphology: morbilliform rash involving face, trunk, arms; can have facial edema
• systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
• spread: starts with face or periorbitally and spreads caudally, no mucosal involvement
• time course: onset 1-6 weeks after first exposure to drug, persists weeks after withdrawal of drug

Epidemiology
• rare: incidence varies considerably depending on drug
• common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
• 10% mortality if severe, undiagnosed, and untreated

Management
• discontinue offending drug ± prednisone 0.5mg/kg per day, consider cyclosporine in severe cases
• may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued
Urticarial

DRUG INDUCED URTICARIA AND ANGIOEDEMA

Clinical Presentation
- morphology: wheals lasting <24hrs, angioedema (face and mucous membranes)
- systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
- time course: hours to days after exposure depending on the mechanism

Epidemiology
- second most common cutaneous drug reaction
- common causative agents: penicillins, ACEI, analgesics/anti-inflammatories, radiographic contrast media

Management
- discontinue offending drug, antihistamines, steroids, epinephrine if anaphylactic

SERUM SICKNESS-LIKE REACTION

Clinical Presentation
- morphology: symmetrical cutaneous eruption (usually urticarial)
- systemic features: malaise, low grade fever, arthralgia, lymphadenopathy
- time course: appears 1-3 wks after drug initiation, resolve 2-3 wks after withdrawal

Epidemiology
- more prevalent in kids 0.02-0.2%
- common causative agents: cefaclor in kids; bupropion in adults

Management
- discontinue offending drug ± topical/oral corticosteroids

Pustular

ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

Clinical Presentation
- morphology: erythematous edema and sterile pustules prominent in intertriginous areas
- systemic features: high fever, leukocytosis with neutrophilia
- spread: starts in face and intertriginous areas and spread to trunk and extremities
- time course: appears 1 wk after drug initiation, resolve 2 wks after withdrawal

Epidemiology
- rare: 1-5/million
- common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

Management
- discontinue offending drug and systemic corticosteroids

Bullous

STEVEN-JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

Clinical Presentation
- morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluent of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss; dusky tender skin, bullae, desquamation/skin sloughing, atypical targets
- classification: BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
- spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
- systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synechiae
- time course: appears 1-3 wk after drug initiation; progression <4 d; epidermal regrowth in 3 wk
- can have constitutional symptoms: malaise, fever, hypotension, tachycardia

Epidemiology
- SJS: 1.2-6/million; TEN: 0.4-1.2/million
- risk factors: SLE, HIV/AIDS, HLA-B1502 (associated with carbamazepine), HLA-B5801 (associated with allopurinol)
- common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections;
- prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss and infection
Differential Diagnosis
• Scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

Management
• discontinue offending drug
• admit to intermediate/intensive care/burn unit
• supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
• IVIg or cyclosporine

Other

FIXED DRUG ERUPTION

Clinical Presentation
• morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
• spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

Epidemiology
• common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

Management
• discontinue offending drug ± prednisone 1mg/kg/d x 2 wk for generalized lesions ± potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

PHOTOSENSITIVITY REACTION

Clinical Presentation
• phototoxic reaction: “exaggerated sunburn” (erythema, edema, vesicles, bullae) confined to sun-exposed areas
• photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

Pathophysiology
• phototoxic reaction: direct tissue injury
• photoallergic reaction: type IV delayed hypersensitivity

Epidemiology
• common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

Management
• sun protection ± topical/oral corticosteroids

Heritable Disorders

Ichthyosis Vulgaris

Clinical Presentation
• xerosis with fine scaling as well as large adherent scales (“fish-scales”)
• affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
• improves in summer, with humidity, and as the child grows into adulthood

Pathophysiology
• genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
• scaling without inflammation

Epidemiology
• 1:300 incidence
• autosomal dominant inheritance
• associated with AD and keratosis pilaris

Investigations
• electron microscopy: keratohyalin granules

Management
• immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or α- or β-hydroxy acids
• intermittent systemic retinoids for severe cases
Neurofibromatosis (Type I; von Recklinghausen’s Disease)

Clinical Presentation
- diagnostic criteria includes 2 or more of the following
  1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child under 5 yr
  2. axillary or inguinal freckling
  3. iris hamartomas (Lisch nodules)
  4. optic gliomas
  5. neurofibromas
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. first degree relative with neurofibromatosis type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see Pediatrics, P84)

Pathophysiology
- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

Epidemiology
- incidence 1:3,000

Investigations
- Wood’s lamp examination to detect café-au-lait macules in patients with pale skin

Management
- refer to orthopedics, ophthalmology, plastics, and psychology for relevant management
- follow-up annually for brain tumours such as astrocytoma
- excise suspicious or painful lesions
- see Pediatrics, P84

Vitiligo

Clinical Presentation
- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply margined white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

Pathophysiology
- acquired autoimmune destruction of melanocytes

Epidemiology
- 1% incidence, polygenic
- 30% with positive family history

Investigations
- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison’s disease, Type I DM
- Wood’s lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discoulouration)

Management
- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or Narrow band UVB
- make-up
- “bleaching” normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

Interventions for Vitiligo
Study: Systematic review of 96 randomized controlled trials with 4,512 participants with vitiligo.
Intervention: Topical treatments, light therapies, oral treatments, surgical methods.
Outcome Measures: Quality of life, >75% repigmentation, adverse effects
Results: Some evidence of therapies for vitiligo but further research required due to differences in design and outcome measures. Evidence exists to support use of combination therapies to be more effective than single agent. Narrowband UVB light, alone or in combination, show better results. Use of topical corticosteroids reported most adverse effects.
Infections

Bacterial Infections

EPIDERMIS

IMPETIGO

Clinical Presentation
- acute purulent infection which appears vesicular; progresses to golden yellow “honey-crusted” lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

Etiology
- GAS, S.aureus, or both

Epidemiology
- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

Differential Diagnosis
- infected eczema, HSV, VZV

Investigations
- Gram stain and culture of lesion fluid or biopsy

Management
- remove crusts, use saline compresses, and topical antiseptic soaks bid
- topical antibacterials such as 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution
- systemic antibiotics such as cloxacillin or cephalaxin for 7-10 d

Location Matters!
- e.g. Group A Strep Infections
  - Impetigo → just below stratum corneum
  - Erysipelas → epidermis and upper dermis only
  - Cellulitis → primarily lower dermis and subcutis (primarily not raised, and demarcation less distinct than erysipelas)
  - Necrotizing fasciitis → deep fascia and muscle

**DERMIS**

</tr>
<tr>
<td>Furuncles (Boils)</td>
<td>S. aureus</td>
<td>Incise and drain large furuncles to relieve pressure and pain If afebrile: hot wet packs, topical antibiotic If febrile: hot wet packs, aspirate pustules (Gram stain and CSF) Cloxacillin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy)</td>
</tr>
<tr>
<td>Carbuncles</td>
<td>S. aureus</td>
<td>Same as for furuncles</td>
</tr>
</tbody>
</table>

### Dermatophytoeses

**Clinical Presentation**
- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

**Pathophysiology**
- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

**Etiology**
- **Trichophyton**, **Microsporum**, **Epidermophyton** species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

**Investigations**
- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

**Management**
- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, or terbinafine or ciclopirox olamine cream applied bid
- oral therapy is indicated for onychomycosis or tinea capitis: terbinafine (Lamisil™ – liver toxicity, CYP2D6 inhibitor) or itraconazole (Sporanox™ – CYP3A4 inhibitor, liver toxicity)
### Table 18. Different Manifestations of Dermatophyte Infection

<td>AD, contact dermatitis, granuloma annulare, psoriasis</td>
<td>Same as for tinea corporis Same as for tinea corporis</td>
</tr>
<tr>
<td><strong>Tinea Unguim</strong> (Onychomycosis)</td>
<td>Crumbling, distally dystrophic nails; yellowish, opaque with subungal hyperkeratotic debris Toenail infections usually precede fingernail infections T. rubrum (90% of all toenail infections)</td>
<td>Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophies, bacterial infections</td>
<td>Microscopic examinations of KOH prep of scales from subungal scraping shows hyphae Culture of subungal scraping or nail clippings on Sabouraud’s agar PAS stain of nail clippings by pathology</td>
</tr>
</tbody>
</table>

## Parasitic Infections

### SCABIES

**Clinical Presentation**
- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crustred papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)

**Pathophysiology**
- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

**Etiology**
- Sarcoptes scabiei (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised
Differential Diagnosis
• atopic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

Investigations
• microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
• skin biopsy may sometimes show scabies mite

Management
• bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
• change underwear and linens; wash twice with detergent in hot water cycle then machine dry
• treat family and close contacts
• pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
• mid potency topical steroids and antihistamines for symptom management

LICE (PEDICULOSIS)

Clinical Presentation
• intensely pruritic, red excoriations, morbilliform rash, caused by louse (a parasite)
• scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
• pubic lice: nits on hairs; excoriations
• body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line and buttocks

Etiology
• Phthirus pubis (pubic), Pediculus humanus capitis (scalp), Pediculus humanus humanus (body): attaches to body hair and feeds
• can transmit infectious agents such as Bartonella quintana and Rickettsia prowazekii

Differential Diagnosis
• bacterial infection of scalp, seborrheic dermatitis

Diagnosis
• lice visible on inspection of affected area or clothing seams

Management
• permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwellada-P® shampoo)
• comb hair with fine-toothed comb using dilute vinegar solution to remove nits
• repeat in 7 d after first treatment
• shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry

BED BUGS (HEMIPTERA)

Clinical Presentation
• burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch and dinner” – in areas with easy access (face, neck, arms, legs, hands)

Etiology
• caused by Cimex lectularius, a small insect that feeds mainly at night (hide in crevices in walls and furniture during the day)

Differential Diagnosis
• dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

Investigations
• none required, but lesional biopsy can confirm insect bite reaction

Management
• professional fumigation
• topical steroids and oral H1-antagonists for symptomatic relief
• definitive treatment is removal of clutter in home and application of insecticides to walls and furniture
**Viral Infections**

**HERPES SIMPLEX**

**Clinical Presentation**
- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- **primary**
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- **secondary**
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- **complications:** dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi’s varicelliform eruption (eczema herpeticum)

**Etiology**
- HSV-1: typically “cold sores” (grouped vesicles at the mucocutaneous junction which quickly burst)
- HSV-2: recurrent on face, lips and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)

**Clinical Presentation**
- HSV-2: usually sexually transmitted; incubation 2-20 d
- gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
- vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
- urethritis: watery discharge in males
- recurrent on vulva, vagina, penis for 5-7 d
- differential diagnosis of genital ulcers: *Candida balanitis*, chancroid, syphilitic chancres

**Investigations**
- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, and direct fluorescent antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

**Management**
- **HSV-1**
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax®/Xerese®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- **HSV-2**
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burow’s compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x/d x 10 d
    - maintenance: acyclovir 400 mg PO bid
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other sexually-transmitted infections STIs
  - for active lesions in pregnancy, see Obstetrics, OB29

**HERPES ZOSTER (SHINGLES)**

**Clinical Presentation**
- unilateral dermalomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson’s sign: shingles on the tip of the nose signified ocular involvement. Shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve (V1)
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

**Etiology**
- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy
Infections

**Differential Diagnosis**
- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

**Investigations**
- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

**Management**
- compress with normal saline, Burow’s, or betadine solution
- analgesics (NSAIDs, amitriptyline)
- famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
- gabapentin 300-600 mg PO tid for post-herpetic neuralgia

**MOLLUSCUM CONTAGIOSUM**

**Clinical Presentation**
- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

**Etiology**
- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)
- virus is self-limited and can take 1-2 yr to resolve

**Investigations**
- none required, however can biopsy to confirm diagnosis

**Management**
- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- topical retinoids
- Aldara* (imiquimod): immune modulator that produces a cytokine inflammation

**WARTS (VERRUCA VULGARIS) (HUMAN PAPILLOMAVIRUS INFECTIONS)**

<table>
<thead>
<tr>
<th>Definition and Clinical Features</th>
<th>Differential Diagnosis</th>
<th>Distribution</th>
<th>HPV Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verruca Vulgaris (Common Warts)</td>
<td>Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV Paring of surface reveals punctate, red-brown specks (thrombosed capillaries)</td>
<td>Molluscum contagiosum, seborheic keratosis</td>
<td>Located at trauma sites: fingers, hands, knees of children and teens</td>
</tr>
<tr>
<td>Verruca Plantaris (Plantar Warts) and Verruca Palmaris (Palmar Warts)</td>
<td>Hyperkeratotic, shiny, sharply margined growths Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges</td>
<td>May need to scrape (“pare”) lesions to differentiate wart from callus and corn</td>
<td>Located at pressure sites: metatarsal heads, heels, toes</td>
</tr>
<tr>
<td>Verruca Planae (Flat Warts)</td>
<td>Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children</td>
<td>Syringoma, seborheic keratosis, molluscum contagiosum, lichen planus</td>
<td>Sites: face, dorsa of hands, shins, knees</td>
</tr>
<tr>
<td>Condyloma Acuminata (Genital Warts)</td>
<td>Skin-coloured pinhead papules to soft cauliflower like masses in clusters Often occurs in young adults, infants, children Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhiteness (subclinical lesions seen with 5% acetic acid x 5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)</td>
<td>Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum</td>
<td>Sites: genitalia and perianal areas</td>
</tr>
</tbody>
</table>
Treatment for Warts
• first line therapies
  ■ salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy, topical cantharone
• second line therapies
  ■ topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
• third line therapies
  ■ curettage, cautery, surgery for non plantar warts, CO₂ laser, oral cimetidine (particularly children),
    intralesional bleomycin (plantar warts), trichloroacetic acid, diphenycprone
• other viruses associated with skin changes, such as measles, roseola, fifth disease, etc.
  • see Pediatrics, Pediatric Exanthems, P55

Yeast Infections

CANDIDIASIS

Etiology
• many species of Candida (70-80% of infections are from Candida albicans)
• opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

Candidal Paronychia
• clinical presentation: painful red swellings of periungal skin
• management: topical agents not as effective; oral antifungals recommended

Candidal Intertrigo
• clinical presentation
  ■ macerated/eroded erythematous patches that may be covered with papules and pustules, located in
    intertriginous areas often under breast, groin, or interdigitally
  ■ peripheral “satellite” pustules
  ■ starts as non-infectious maceration from heat, moisture, and friction
• predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
• management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream bid until
  rash clears

PITYRIASIS (TINEA) VERSICOLOR

Clinical Presentation
• asymptomatic superficial fungal infection with brown/white scaling macules
• affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
• common sites: upper chest and back

Pathophysiology
• microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable
  pigmentation
• affinity for sebaceous glands; require fatty acids to survive

Etiology
• Pityrosporum ovale (Malassezia furfur)
• also associated with folliculitis and seborrheic dermatitis
• predisposing factors: summer, tropical climates, excessive sweating, Cushing’s syndrome, prolonged
  corticosteroid use

Investigations
• clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

Management
• ketoconazole shampoo or cream daily
• topical terbinafine or ciclopirox olamine bid
• systemic fluconazole or itraconazole for 7 d if extensive

Sexually Transmitted Infections

SYPHILIS

Clinical Presentation
• characterized initially by a painless ulcer (chancre)
• following inoculation, systemic infection with secondary and tertiary stages

Etiology
• Treponema pallidum
• transmitted sexually, congenitally, or rarely by transfusion
Table 20. Stages of Syphilis

<table>
<thead>
<tr>
<th>Clinical Presentation</th>

<td>3-7 yr after secondary</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Main skin lesion: ‘Gumma’ – a granulomatous non-tender nodule</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**GONOCOCCEMIA**

**Clinical Presentation**
- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

**Etiology**
- *Neisseria gonorrhoeae*

**Investigations**
- requires high index of clinical suspicion plays because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

**Management**
- notify Public Health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 1 g IM

**HSV**
- see *Viral Infections*, D29

**HPV**
- see *Viral Infections*, D30

**Latent Syphilis**
- 70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection

**Natural History of Untreated Syphilis**
- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)
Pre-Malignant Skin Conditions

Actinic Keratosis (Solar Keratosis)

Clinical Presentation
- ill-defined, scaly erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

Pathophysiology
- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1,000), but higher likelihood if AK is persistent
- UV-induced p53 gene mutation
- risk factors: increased age, light skin/eyes/hair, immunosuppression, syndromes such as albinism or xeroderma pigmentosum
- risk factors for malignancy: immunosuppression, history of skin cancer, persistence of the AK

Epidemiology
- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in darker skin as melanin is protective

Differential Diagnosis
- SCC in situ, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

Investigations
- biopsy lesions that are refractory to treatment

Management
- destructive: cryotherapy, electrodessication, and curettage
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-Fluorouracil cream (for 2-4 wk), Imiquimod 5% (2 times per wk for 16 wk), Imiquimod 3.75% (daily for 2 wk then none for 2 wk then daily for 2 wk), Ingenol Mebutate gel 0.015% (daily for 3 d on the head and neck), Ingenol mebutate 0.05% gel (daily for 2 d on the body)
  - photodynamic therapy
  - excision

Leukoplakia

Clinical Presentation
- a morphologic term describing homogenous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

Pathophysiology
- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption

Epidemiology
- 1%-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

Differential Diagnosis
- lichen planus, oral hairy leukoplakia

Investigations
- biopsy is mandatory because it is premalignant

Management
- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, follow-up
- moderate/dysplastic lesions: excision, cryotherapy

Types of AK
- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium
Malignant Skin Tumours

Non-Melanoma Skin Cancers

BASAL CELL CARCINOMA

Subtypes
- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent ("pearly") telangiectatic border, and depressed/eroded/ulcered centre
- pigmented variant
  - flecks of pigment in translucent lesion with surface telangiectasia
- superficial variant
  - flat, tan to red-brown plaque, often with scaly, pearly border and fine telangiectasia at margin
- least aggressive subtype
- sclerosing (morpheiform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

Pathophysiology
- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on face
  - may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin syndrome)

Epidemiology
- most common malignancy in humans
- 75% of all malignant skin tumours >40 yr, increased prevalence in the elderly
- M>F, skin phototypes I and II, chronic sun exposure

Differential Diagnosis
- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular malignant melanoma, SCC

Management
- imiquimod 5% cream (Aldara*) or cryotherapy is indicated for superficial BCCs on the trunk
- fluorouracil and photodynamic therapy can also be used for superficial BCC
- shave excision + electrodessication and curettage for most types of BCCs, not including morpheiform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct
- radiotherapy used in advanced cases of BCC where surgical intervention is not an option
- vismodegib is approved for metastatic BCC
- life-long follow up every 6 mo to 1 yr
- 95% cure rate if lesion <2 cm in diameter or if treated early

SQUAMOUS CELL CARCINOMA

Clinical Presentation
- indurated, pink/red/skin-coloured papule/plaque/nodule with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- exophytic (grows outward), may present as a cutaneous horn
- sites: face, ears, scalp, forearms, dorsum of hands

Pathophysiology
- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

Epidemiology
- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients SCC is most common cutaneous malignancy, with increased mortality as compared to non-immunocompromised population

Differential Diagnosis
- benign: nummular eczema, psoriasis, irritated seborrhoeic keratosis
- malignant: keratoacanthoma, Bowen's disease, BCC
Management
- surgical excision with primary closure, skin flaps or grafting
- Mohs surgery
- lifelong follow-up (more aggressive treatment than BCC)

Prognosis
- good prognostic factors: early treatment, negative margins, and small size of lesion
- SCCs that arise from AK metastasize less frequently (~1%) than other SCCs arising de novo in old burns (2-5% of cases)
- overall control is 75% over 5 yr, 5-10% metastasize
- metastasis rates are higher if diameter > 2 cm, depth > 4 mm, recurrent, involvement of bone/muscle/nerve, location on scalp/ears/nose/lips, immunosuppressed, caused by arsenic ingestion, or tumour arose from scar/chronic ulcer/burn/genital tract/sinus tract

BOWEN’S DISEASE (SQUAMOUS CELL CARCINOMA IN SITU)

Clinical Presentation
- sharply demarcated erythematous patch/thin plaque with scale and/or crusting
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

Management
- same as for BCC
- biopsy required for diagnosis
- topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify margins of poorly defined tumours
- cryosurgery
- shave excision with electrodesiccation and curettage

KERATOACANTHOMA

Clinical Presentation
- rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled crater, resembling an erupting volcano
- may spontaneously regress within a year, leaving a scar
- sites: sun-exposed skin

Pathophysiology
- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

Etiology
- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

Epidemiology
- >50 yr, rare <20 yr

Differential Diagnosis
- treat as SCC until proven otherwise
- hypertrophic solar keratosis, verruca vulgaris

Management
- surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated similarly to SCC

Malignant Melanoma

Clinical Presentation
- malignant characteristics of a mole: “ABCDE” mnemonic
- sites: skin, mucous membranes, eyes, CNS

Clinical Subtypes of Malignant Melanoma
- lentigo maligna
  - malignant melanoma in situ (normal and malignant melanocytes confined to the epidermis)
  - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
  - lesion grows radially and produces complex colours
  - often seen in the elderly
  - 10% evolve to lentigo maligna melanoma

Does this Patient have a Mole or Melanoma?

**ABCDE checklist**

- Asymmetry
- Border (irregular and/or indistinct)
- Colour (varied)
- Diameter (increasing or >6 mm)
- Enlargement, elevation, evolution (i.e. change in colour, size, or shape)

Sensitivity 92% (CI 82-96%)
Specificity 100% (CI 94-100%)

JAMA 1998;279:696-701
• **lentigo maligna melanoma** (15% of all melanomas)
  - malignant melanocytes invading into the dermis
  - associated with pre-existing solar lentigo, not pre-existing nevi
  - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  - with time, colour changes from uniform brown to dark brown with black and blue
  - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
• **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discolouration, focal papules or nodules
  - ulcerate and bleed with growth
• **nodular melanoma** (30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - "EFG" Elevated, FIRM, Growing
• **acrolentiginous melanoma** (5% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungal skin
  - melanomas on mucous membranes have poor prognosis

**Pathophysiology**
• malignant neoplasm of pigment forming cells (melanocytes and nevus cells)

**Epidemiology**
• incidence 1/75 (Canada) 1/50 (US)
• risk factors: numerous moles, fair skin, red hair, positive personal/family history, 1 large congenital nevus (>20 cm), familial dysplastic nevus syndrome, any dysplastic nevi, immunosuppression, > 50 common nevi, and sun exposure with sunburns, tanning beds
• most common sites: back (M), calves (F)
• worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

**Differential Diagnosis**
• benign: nevi, solar lentigo, seborrheic keratosis
• malignant: pigmented BCC

**Management**
• excisional biopsy preferable, otherwise incisional biopsy
• remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
• beware of lesions that regress – tumour is usually deeper than anticipated
• high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
• newer chemotherapeutic, gene therapies, and vaccines starting to be used in metastatic melanoma
• radiotherapy may be used as adjunctive treatment

</tbody>
</table>

a = no ulceration; b = ulceration

**Other Cutaneous Cancers**

**CUTANEOUS T-CELL LYMPHOMA**

**Clinical Presentation**
• **Mycosis fungoides** (limited superficial type)
  - characterized by erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation, hypopigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease
• **Sézary syndrome** (widespread systemic type)
  - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10^9/L with Sézary cells
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - often fatal
Pathophysiology
• clonal proliferation of skin-homing CD4 T-cells

Epidemiology
• >50 yr old, M:F 2:1

Differential Diagnosis
• tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease

Investigations
• skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
• blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
• imaging (for systemic involvement)

Management
• Mycosis fungoides
  ■ depends on stage of disease
  ■ topical steroids and/or PUVA, narrow band UVB (NBUVB, 311-313nm)
• Sézary syndrome
  ■ oral retinoids and IFN
  ■ extra-corporeal photopheresis
  ■ may need radiotherapy for total skin electron beam radiation
  ■ may maintain on UV therapy
  ■ other chemotherapy agents

Diseases of Hair Density

Hair Growth
• hair grows in a cyclic pattern that is defined in 3 stages (most scalp hairs are in anagen phase)
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
• total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
• growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

Non-Scarring (Non-Cicatricial) Alopecia

ANDROGENETIC ALOPECIA

Clinical Presentation
• male- or female-pattern alopecia
• males: fronto-temporal areas progressing to vertex, entire scalp may be bald
• females: widening of central part, “Christmas tree” pattern

Pathophysiology
• action of testosterone on hair follicles

Epidemiology
• males: early 20s-30s
• females: 40s-50s

Management
• minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
• females: spironolactone (anti-androgenic effects), cyproterone acetate (Diane-35®)
• males: finasteride (Propecia®) (5-α-reductase inhibitor) 1 mg/d
• hair transplant

PHYSICAL
• trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
• traumatic (e.g. tight “corn-row” braiding of hair, wearing tight pony tails, tight tying of turbans)
TELOGEN EFFLUVIUM

Clinical Presentation
- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

Pathophysiology
- variety of precipitating factors
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few months but may not be complete

ANAGEN EFFLUVIUM

Clinical Presentation
- hair loss due to insult to hair follicle impairing its mitotic activity (growth stage)

Pathophysiology
- precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

ALOPECIA AREATA

Clinical Presentation
- autoimmune disorder characterized by patches of complete hair loss often localized to scalp but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- “exclamation mark” pattern (hairs fractured and have tapered shafts, i.e. looks like “!“)
- may be associated with pernicious anemia, vitiligo, thyroid disease, Addison’s disease
- spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress

Management
- generally unsatisfactory
- intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- UV or PUVA therapy
- immunomodulatory (diphencyprone)

Scarring (Cicatricial) Alopecia

Clinical Presentation
- irreversible loss of hair follicles with fibrosis

Etiology
- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HZV)
- inflammatory
  - lichen planus (lichen planopilaris)
  - DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
  - morphea: “coup de sabre” with involvement of centre of scalp
  - central centrifugal cicatricial alopecia (CCCA); seen in up to 40% of black women, starting at central scalp; one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population

Investigations
- biopsy from active border

Management
- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials

DDx of Scarring (Cicatricial) Alopecia

Developmental/Hereditary Disorders
- Aplasia cutis congenita
- Epidermal nevi
- Romberg’s syndrome
- Generalized follicular hamartoma

Primary Causes
- Group 1: Lymphocytic
  - DLE
  - Lichen planopilaris
  - Central centrifugal cicatricial alopecia
- Classic pseudopelade
- Group 2: Neutrophilic
  - Folliculitis decalvans
  - Dissecting scalp cellulitis
- Group 3: Mixed
  - Acne keloidalis nuchae

Secondary Causes
- Infectious agents
- Bacterial (e.g. post-cellulitis)
- Fungal (e.g. kerion tinea capitis)
- Neoplasms (e.g. BCC, SCC, lymphomas, and metastatic tumours)
- Physical agents
  - Mechanical trauma
  - Burns
  - Radiotherapy
  - Caustic chemicals

**Raynaud’s Phenomenon DDx**

**COLD HAND**
- Cryoglobulins/Cryofibrinogens
- Obstruction/Closure
- Lupus erythematosus, other connective tissue disease
- DM/Drugs
- Hematologic problems (polycythemia, leukemia, etc)
- Arterial problems (atherosclerosis)
- Neurologic problems (vascular tone)
- Disease of unknown origin (idiopathic)

**Acanthosis Nigricans**

An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with DM, obesity, and other endocrine disorders and malignancy. It is a cutaneous marker of tissue insulin resistance.
Pediatric Exanthems

**Miscellaneous Lesions**

**Angioedema and Urticaria**

**Angioedema**
- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
- triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  - non-allergic drug reaction (drugs include ACEI)
  - acquired C1 inhibitor deficiency
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

**Urticaria**
- also known as “hives”
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

**Table 24. Classification of Urticaria**

**Approach to Urticaria**
- Thorough Hx and P/E
- Acute: no immediate investigations needed; consider referral for allergy testing
- Chronic: further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- Vascular: biopsy of lesion and referral to dermatology

**Wheal**
- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts < 24 h
- Associated with mast cell release of histamine
- May be pruritic

**Mastocytosis (Urticaria Pigmentosa)**
- Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier’s sign), due to mast cell degranulation; this occurs within minutes
**Erythema Nodosum**

**Clinical Presentation**
- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs, knees, arms, (typically shins)
- associated with arthralgia, fever, malaise

**Etiology**
- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, Yersinia
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

**Epidemiology**
- 15-30 yr old; F:M = 3:1
- lesions last for days and spontaneously resolve in 6 wk

**Investigations**
- chest x-ray (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

**Management**
- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause

---

**Pruritus**

**Clinical Presentation**
- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

**Etiology**
- dermatologic – generalized
  - asthenic dermatitis ("winter itch" due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin's lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrotoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

**Investigations**
- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture and serology for parasites

**Management**
- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid-sparing
Wounds and Ulcers

- see Plastic Surgery, PL8, PL15

Sunburn

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA and UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am-4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-30 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
    - all are effective against the UVA and UVB spectrum
    - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

Topical Steroids

### Table 25. Potency Ranking of Topical Steroids

<table>
<thead>

</tbody>
</table>

**Side Effects of Topical Steroids**

- Local: atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance), telangiectasia, striae, hypopigmentation
- Systemic: suppression of HPA axis
### Dermatologic Therapies

#### Table 26. Common Topical Therapies

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calcipotriol (Dovonex*)</td>
<td>0.005% cream, ointment, scalp solution, apply bid For maintenance therapy apply OD</td>
<td>Psoriasis</td>
<td>Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2.5-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk &gt; 14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)</td>
</tr>
<tr>
<td>Imiquimod (Aldara®)</td>
<td>5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk</td>
<td>Genital warts Cutaneous warts AK Superficial BCC</td>
<td>Avoid natural/artificial UV exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion</td>
</tr>
<tr>
<td>Permethrin (Kwellada® P Lotion and Nix® Dermal Cream)</td>
<td>1% or 5% cream, applied once overnight to all skin areas from neck down, repeated one week later</td>
<td>Scabies (Kwellada-P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)</td>
<td>Do not use in children &lt; 2 yr Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d</td>
</tr>
<tr>
<td>Pimecrolimus (Elidel®)</td>
<td>1% cream bid Use for as long as lesions persist and discontinue upon resolution of symptoms</td>
<td>AD (mild to moderate)</td>
<td>Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive</td>
</tr>
<tr>
<td>Tacrolimus Topical (Protopic®)</td>
<td>0.03% (children) or 0.1% (adults) ointment bid Continue for duration of disease PLUS 1 wk after clearing</td>
<td>AD (mild to moderate)</td>
<td>Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive</td>
</tr>
</tbody>

</thead>
<tbody>
<tr>
<td>Acitretin (Soriatane®)</td>
<td>25-50 mg PO OD; maximum 75 mg/d</td>
<td>Severe psoriasis Other disorders of hyperkeratinization (ichthyosis, Darier’s disease)</td>
<td>Monitoring strategies Monitor lipids, LFTs at baseline and q1-2wk until stable Long-term effects preclude use of cyclosporine for &gt;2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug</td>
</tr>
<tr>
<td>Antivirals</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>famciclovir (Famvir®)</td>
<td>250 mg PO tid x 7-10 d (for 1st episode of genital herpes) 125 mg PO bid x 5 d (for recurrent genital herpes)</td>
<td>Chickenpox Herpes zoster Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis</td>
<td>Side effects Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function</td>
</tr>
<tr>
<td>valacyclovir (Valtrex®)</td>
<td>1000 mg PO bid x 7-10 d (for 1st episode of genital herpes) 500 mg PO bid x 5 d (for recurrent genital herpes)</td>
<td></td>
<td>Side effects Dizziness, depression, abdominal pain Reduce dose if impaired renal function Drug interactions cimetidine</td>
</tr>
<tr>
<td>Cyclosporine (Neoral®)</td>
<td>2.5-4 mg/kg/d PO divided bid Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg q2wk Concomitant dose of magnesium may protect the kidneys</td>
<td>Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD</td>
<td>Monitoring strategies Blood pressure, renal function Drug interactions Abnormal renal function, uncontrolled hypertension, malignancy (except NMOSD), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporine for &gt;2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug</td>
</tr>
<tr>
<td>Dapsone</td>
<td>50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk</td>
<td>Dermatitis herpetiformis, neutrophic dermatoses</td>
<td>Monitoring strategies Obtain G6PD levels before initiating; in the initial two wk obtain methemoglobin levels and follow the blood counts carefully for the first few months Side effects Neuropathy Hemolysis (Vitamin C and E supplementation can help prevent this) Drug interactions Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours</td>
</tr>
</tbody>
</table>
## Table 27. Common Oral Therapies (continued)

<table>
<thead>
<tr>
<th>Drug Name</th>
<th>Dosing Schedule</th>
<th>Indications</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Isotretinoin</strong> <em>(Accutane®)</em></td>
<td>0.5-1 mg/kg/d given OD, to achieve a total dose of 120 mg/kg (20-24 wk)</td>
<td>Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne</td>
<td>Monitoring strategies Baseline lipid profile and LFTs before treatment, β-hCG Contraindications Teratogenic – in sexually active females, 2 forms of reliable contraception necessary Generally regarded as unsafe in lactation Side effects Night blindness, decreased tolerance to contact lenses, dry mucous membranes May transiently exacerbate acne, dry skin Depression, myalgia Drug interactions Do not use at the same time as tetracycline or minocycline – both may cause pseudotumour cerebri Discontinue vitamin A supplements Drug may be discontinued at 16-20 wk when nodule count has dropped by &gt;70%; a second course may be initiated after 2 mo prn Refractory cases may require &gt;3 courses</td>
</tr>
<tr>
<td><strong>Itraconazole</strong> <em>(Sporanox®)</em></td>
<td>100-400 mg PO OD, depending on infection Tinea corporis/cruris/versicolor: 200 mg PO OD x 7 d Tinea pedis: 200 mg PO bid x 7 d Toenails: 200 mg PO bid x 7 d once per month, repeated 3x Fingernail involvement only: 200 mg PO bid x 7 d once per month, repeated 2x</td>
<td>Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis</td>
<td>Contraindications CHF Side effects Serious hepatotoxicity Drug Interactions Inhibits CYP3A4 Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs) Give capsules with food, capsules must be swallowed whole</td>
</tr>
<tr>
<td><strong>Ivermectin</strong> <em>(Mectizan®, Stromectol®)</em></td>
<td>200-250 µg/kg PO qweekly x 2 Take once as directed; repeat one wk later</td>
<td>Onchocerciasis (USA only) Not licensed for use in Canada Also effective for: scabies</td>
<td>No significant serious side effects Efficacious</td>
</tr>
<tr>
<td><strong>Methotrexate</strong> <em>(Trexall®)</em></td>
<td>10-25 mg qwk, PO, IM, or IV Max: 30 mg/qwk To minimize side effects, administer with folic acid supplementation: 1-5 mg OD</td>
<td>Psoriasis AD Lymphomatoid papulosis May also be effective in: cutaneous sarcoidosis</td>
<td>Monitoring strategies Baseline renal, liver, and hematological studies Contraindications Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy May be combined with cyclosporine to allow lower doses of both drugs</td>
</tr>
<tr>
<td><strong>Minocycline</strong> <em>(Minocin®)</em></td>
<td>50-100 mg PO bid Taper to 50 mg PO OD as acne lessens</td>
<td>Acne vulgaris Rosacea</td>
<td>Contraindications Caution if impaired renal or liver function Drug interactions Do not use with isotretinoin (Accutane®) Extensive; affects multiple organ systems including CNS, teeth, eyes, bones, renal, and skin (photosensitivity and blue pigmentation) Drug-induced lupus (check p-ANCA) Alternative to tetracycline</td>
</tr>
<tr>
<td><strong>OCPs</strong> <em>(TriCyclen®, Diane 35®, Alesse®)</em></td>
<td>1 pill PO once daily</td>
<td>Hormonal acne (chin, jawline) Acne associated with polycystic ovarian syndrome or other endocrine abnormalities</td>
<td>All combined OCPs are helpful in acne but those listed on the left have undergone RCTs Contraindications Smoking, HTN, migraines with aura, pregnancy Routine gynecological health maintenance should be up to date</td>
</tr>
<tr>
<td><strong>Spironolactone</strong></td>
<td>50-100 mg PO OD alone or with OCPs</td>
<td>Hormonal acne (chin, jawline) Acne with endocrine abnormality</td>
<td>Contraindications Pregnancy Side effects Menstrual irregularities at higher doses if not on OCPs Breast tenderness, mild diuresis common Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas</td>
</tr>
<tr>
<td><strong>Terbinafine</strong> <em>(Lamisil®)</em></td>
<td>250 mg PO OD x 2 wk Fingernails x 6 wk Toenails x 12 wk Confirm diagnosis prior to treatment</td>
<td>Onychomycosis Tinea corporis, cruris, pedis, capitis</td>
<td>Contraindications Pregnancy, chronic or active liver disease Drug interactions Potent inhibitor of CYP2D6; use with caution when also taking β-blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity</td>
</tr>
<tr>
<td><strong>Tetracycline</strong></td>
<td>250-500 mg PO bid to tid Taken 1 h before or 2 h after a meal</td>
<td>Acne vulgaris Rosacea Bullous pemphigoid</td>
<td>Contraindications Severe renal or hepatic dysfunction</td>
</tr>

Patient Assessment/Management

1. Rapid Primary Survey

- Airway maintenance with C-spine control
- Breathing and ventilation
- Circulation (pulses, hemorrhage control)
- Disability (neurological status)
- Exposure (complete) and Environment (temperature control)
  - continually reassessed during secondary survey
  - changes in hemodynamic and/or neurological status necessitates a return to the primary survey beginning with airway assessment
- IMPORTANT: Always watch for signs of shock while doing primary survey

A. AIRWAY
- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently
- assess for facial fractures/edema/burns (impending airway collapse)

Airway Management
- anatomic optimization to allow for oxygenation and ventilation

1. Basic Airway Management
- protect the C-spine
- head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

2. Temporizing Measures
- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- "rescue" airway devices (e.g. laryngeal mask airway, Combitube®)
- transtracheal jet ventilation through cricothyroid membrane (last resort)

3. Definitive Airway Management
- ETT intubation with in-line stabilization of C-spine
  - orotracheal ± RSI preferred
  - nasotracheal may be better tolerated in conscious patient
  - relatively contraindicated with basal skull fracture
  - does not provide 100% protection against aspiration
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
- cricothyroidotomy

Contraindications to Intubation
- supraglottic/glottic pathology that would preclude successful intubation
**B. BREATHING**

- **Look**
  - mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- **Feel**
  - tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

**Breathing Assessment**
- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

**Management of Breathing**
- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing FiO₂)
- Bag-Valve mask and CPAP to supplement inadequate ventilation

**C. CIRCULATION**

**Definition of Shock**
- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

**Table 1. Major Types of Shock**

**Indications for Intubation**
- Unable to protect airway (e.g. GCS < 8; airway trauma)
- Inadequate oxygenation with spontaneous respiration (O₂ saturation < 93% with 100% O₂, or rising pCO₂)
- Anticipatory: in trauma, overdose, CHF, asthma, COPD, and smoke inhalation injury
- Anticipated transfer of critically ill patients

**Rescue Techniques in Intubation**
- Bougie (used like a guidewire)
- Glide scope
- Louped stylet (use light through skin to determine if ETT in correct place)
- Fiberoptic intubation – indirect visualization using fiberoptic cable

**Medications that can be Delivered via ETT**

- NALOXONE (Narcotan®)
- Atropine
- Epinephrine
- Lidocaine

**Shock in a trauma patient is hemorrhagic until proven otherwise**

**Estimated Systolic Blood Pressure Based on Position of Most Distal Palpable Pulse**

Management of Hemorrhagic Shock
• clear airway and breathing either first or simultaneously
• apply direct pressure on external wounds while elevating extremities. Do not remove impaled objects in
the emergency room setting as they may tamponade bleeds
• start TWO LARGE BORE (14-16G) IVs in the brachial/cephalic vein of each arm
• run 1-2 L bolus of IV Normal Saline/Ringer's Lactate (warmed, if possible)
• if continual bleeding or no response to crystalloids, consider pRBC transfusion, ideally crossmatched. If
crossmatched blood is unavailable, consider O- for women of childbearing age and O+ for men. Use
FFP, platelets or tranexamic acid in early bleeding
• consider common sites of internal bleeding (abdomen, chest, pelvis, long bones) where surgical
intervention may be necessary

D. DISABILITY
• assess LOC using GCS
• pupils
  ▪ assess equality, size, symmetry, reactivity to light
  ▪ inequality/slugghish suggests local eye problem or lateralizing CNS lesion
  ▪ relative afferent pupillary defect (swinging light test) – optic nerve damage
  ▪ extraocular movements and nystagmus
  ▪ fundoscopy (papilledema, hemorrhages)
  ▪ reactive pupils + decreased LOC: metabolic or structural cause
  ▪ non-reactive pupils + decreased LOC: structural cause (especially if asymmetric)

Glasgow Coma Scale
• for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical
  prognosis
• most useful if repeated; change in GCS with time is more relevant than the absolute number
• less meaningful for metabolic coma
• patient with deteriorating GCS needs immediate attention
• prognosis based on best post-resuscitation GCS
• reported as a 3 part score: Eyes + Verbal + Motor = Total
• if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury

E. EXPOSURE/ENVIRONMENT
• expose patient completely and assess entire body for injury; log roll to examine back
• DRE
• keep patient warm with a blanket ± radiant heaters; avoid hypothermia
• warm IV fluids/blood
• keep providers safe (contamination, combative patient)

2. Resuscitation
• done concurrently with primary survey
• attend to ABCs
• manage life-threatening problems as they are identified
• vital signs q5-15 min
• ECG, BP, and O₂ monitors
• Foley catheter and NG tube if indicated
• tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology
  screen, cross and type

</tr>
</tbody>
</table>

#### 3. Secondary Survey

- done after primary survey once patient is hemodynamically and neurologically stabilized
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, pelvis – required in blunt trauma, consider T-spine and L-spine)

**HISTORY**

- "SAMPLE": Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

![Figure 2. Four areas of a FAST](image-url)
**PHYSICAL EXAM**

**Head and Neck**
- palpation of facial bones, scalp

**Chest**
- inspect for: 1. midline trachea and 2. flail segment: ≥2 rib fractures in ≥2 places; if present look for associated hemorhorax, pneumothorax, and contusions
- ausculate lung fields
- palpate for subcutaneous emphysema

**Abdomen**
- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- DRE for GI bleed, high riding prostate and anal tone

**Musculoskeletal**
- examine all extremities for swelling, deformity, contusions, tenderness, ROM
- check for pulses (using Doppler probe) and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

**Neurological**
- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
- assess spinal cord integrity
- conscious patient: assess distal sensation and motor function
- unconscious patient: response to painful or noxious stimulus applied to extremities

**INITIAL IMAGING**
- non-contrast CT head/face/C-spine (rule out fractures and bleeds)
- chest x-ray
- FAST (see Figure 2) or CT abdomen/pelvis (if stable)
- pelvis x-ray

---

**Ethical Considerations**

**Consent to Treatment: Adults**
- see Ethical, Legal, and Organizational Medicine, ELOM6
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- exceptions to the Emergency Rule - treatment cannot be initiated if
  - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient’s wishes have changed
  - an advanced directive is available (e.g. do not resuscitate order)
  - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
- care can be withdrawn if necessary at a later time or if wishes are clarified by family

**Consent to Treatment: Children**
- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions
- if parents refuse treatment that is life-saving or will potentially alter the child’s quality of life, CAS must be contacted – consent of CAS is needed to treat

**Other Issues of Consent**
- need consent for HIV testing, as well as for administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

**Duty to Report**
- law may vary depending on province and/or state
- examples: gunshot wounds, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others
Traumatology

- epidemiology
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: lethal injuries, death usually at the scene
  - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, etc.
- injuries fall into two categories
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

Considerations for Traumatic Injury

- important to know the mechanism of injury in order to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

Table 5. Mechanisms and Considerations of Traumatic Injuries

</tbody>
</table>

Head Trauma

- see Neurosurgery, NS29
- 60% of MVC-related deaths are due to HI

Specific Injuries

- fractures
  - Dx: non-contrast head CT and physical exam
  - A. skull fractures
    - vault fractures
      - linear, non-depressed
        - most common
        - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
      - depressed
        - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
  - basal skull
    - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
    - clinical diagnosis superior as poorly visualized on CT
  - B. facial fractures (see Plastic Surgery, PL29)
    - zygomatic injury
    - beware of open fracture or sinus fractures (risk of infection)
    - severe facial fractures may pose risk to airway from profuse bleeding

Signs of Basal Skull Fracture

- Battle’s sign (bruised mastoid process)
- Hemoptyanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea
• **scalp laceration**
  - can be a source of significant bleeding
  - achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)

• **neuronal injury**
  A. diffuse
    - mild TBI = concussion
      - transient alteration in mental status that may involve loss of consciousness
        - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
        - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
  B. focal injuries
    - contusions
    - intracranial hemorrhage (epidural, subdural, intracerebral)

**ASSSESSMENT OF BRAIN INJURY**

**History**
- pre-hospital status
- mechanism of injury

**Physical Exam**
- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing’s response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by
  1. LOC
    - GCS ≤ 8 intubate, any change in score of 3 or more = serious injury
    - mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
    - may become more subtle with increasing severity of injury
- reassess frequently

**Investigations**
- labs: CBC, electrolytes, PT/PTT or INR/PTT, glucose, toxicology screen
- CT scan (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging, often with CT head and neck to exclude intracranial hemorrhage/hematoma

**Management**
- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP > 90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
- medical management
  - seizure treatment/prophylaxis
    - benzodiazepines, phenytoin, phenobarbital
    - steroids are of no proven value
  - treat suspected raised ICP, consider if HI with signs of increased ICP:
    - intubate
    - calm (sedate) if risk for high airway pressures or agitation
    - paralyze if agitated
    - hyperventilate (100% O₂) to a pCO₂ of 30-35 mmHg
    - elevate head of bed to 20°
    - adequate BP to ensure good cerebral perfusion
    - diurese with mannitol 1 g/kg infused rapidly (contraindicated in shock/renal failure)

**Disposition**
- neurosurgical ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits
Mild Traumatic Brain Injury

**Epidemiology**
- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see Neurosurgery, NS29)
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

**Clinical Features**
- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

**Etiology**
- falls, MVC, struck by an object, assault, sports

**Investigations**
- neurological exam
- concussion recognition tool (see thinkfirst.ca)
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

**Treatment**
- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- early rehabilitation to maximize outcomes
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

**Prognosis**
- most recover with minimal treatment
- athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (Figure 3)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (SCIWORA = spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

**History**
- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis weakness, paresthesia

**Physical Exam**
- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
- when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

**Investigations**
- bloodwork: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
  - thoracolumbar x-rays
  - AP and lateral views
- indications
  - patients with C-spine injury
  - unconscious patients (with appropriate mechanism of injury)
  - patients with neurological symptoms or findings
  - patients with deformities that are palpable when patient is log rolled
  - patients with back pain
  - patients with bilateral calcaneal fractures (due to fall from height)
  - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
  - consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate

---

<tr>
<td>Abnormal neurological exam</td>
<td>C-spine cleared</td>
</tr>
</tbody>
</table>

**Management of Cord Injury**

- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- high dose steroids: methylprednisolone 30 mg/kg bolus, then 5.4 mg/kg/h drip, start within 6-8 h of injury (controversial and recently has less support)
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
- low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact but loss of innervation of intercostals and other accessory muscles of breathing)
- high cervical cord injury (above C4) may require intubation and ventilation
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

**Approach to C-Spine X-Rays**

- 3-view C-spine series is the screening modality of choice
  1. lateral C1-T1 ± swimmer’s view
     - lateral view is best, identifies 90-95% of injuries
  2. odontoid view (open mouth or oblique submentum view)
     - examine the dens for fractures
       - if unable to rule out fracture, repeat view or consider CT or plain film tomography
     - examine lateral aspects of C1 and spacing relative to C2

---

**The Canadian C-Spine Rule**

*JAAM 2001;286:1841-1848*

**For Alert (GCS Score < 15) and Stable Trauma Patients where C-Spine Injury is a Concern**

1. Any high-risk factor that mandates radiography?
   - Age >65 yr
   - Dangerous mechanism*
   - Paraparesis in extremities

**Radiography**

2. Any one low-risk factor that allows safe assessment of ROM?
   - Simple rear-end MVC or 5 star vehicle
   - Sitting position in ED or Ambulatory at any time
   - Delayed onset of neck pain
   - Absence of midline C-spine tenderness

**No**

3. Able to actively rotate neck >45° left and right
   - Yes
   - No

**No radiography**

*Dangerous Mechanism:
- Fall from >1 meter/5 stairs
- Axial load to head (e.g. diving)
- MVC high-speed (>100 km/h), rollover, ejection
- Motorized recreational vehicles
- Bicycle collision

Simple rear-end MVC excludes:
- Pushed into oncoming traffic
- Hit by bus/large truck
- Rollover
- Hit by high-speed vehicle

9 Delayed: net immediate onset of neck pain

---

**Figure 3. Approach to clearing the C-spine**

**Can Clear C-Spine if**

- oriented to person, place, time, and event
- no evidence of intoxication
- no posterior midline cervical tenderness
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

**Approach to C-Spine x-rays**

1. Anterior vertebral line
2. Posterior vertebral line (anterior margin of spinal canal)
3. Posterior border of facets
4. Laminar fusion line (posterior margin of spinal canal)
5. Posterior spinous line (along tips of spinous processes)

**Figure 4. Lines of contour on a lateral C-spine x-ray**

Prevertebral soft tissue swelling is only 49% sensitive for injury
3. AP view
- alignment of spinous processes in the midline
- spacing of spinous processes should be equal
- check vertebral bodies and facet dislocations

Table 6. Interpretation of Lateral View: The ABCS

<table>

</tr>
</tbody>
</table>

Sequelaes of C-Spine Fractures
- see Neurosurgery NS32
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
  - decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
  - watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
  - occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
  - provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
  - chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
  - signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
  - common triggers
    - GU causes: bladder distention, urinary tract infection, and kidney stones
    - GI causes: fecal impaction or bowel distension
  - treatment: monitoring and controlling BP, prior to addressing causative issue

Chest Trauma
- two types: those found and managed in 1st survey and those found and managed in 2nd survey

Table 7. Life-Threatening Chest Injuries Found in 1st Survey

<table>
<thead>
<tr>
<th>Physical Exam</th>
<th>Investigations</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Airway Obstruction</td>

<td>Blunt trauma to chest or abdomen (e.g. high lap belt in MVC)</td>
<td>CXR: abnormality of diaphragm/lower lung fields/ NG tube placement CT scan and endoscopy; sometimes helpful for diagnosis Laparotomy for diaphragm repair and associated intra-abdominal injuries</td>
</tr>
<tr>
<td>Esophageal Injury</td>
<td>Usually penetrating trauma (pain out of proportion to degree of injury)</td>
<td>CXR: mediastinal air (not always) Esophagram (Gastrograffin®) Flexible esophagoscopy Early repair (within 24 h) improves outcome but all require repair</td>
</tr>
<tr>
<td>Aortic Tear</td>
<td>Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent) Decreased femoral pulses, differential arm BP (arch tear)</td>
<td>CXR, CT scan, transesophageal echo, aortography (gold standard) Thoracotomy (may treat other severe injuries first)</td>
</tr>
<tr>
<td>Blunt Myocardial Injury (rare)</td>
<td>Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose) Physical exam: overlying injury, e.g. fractures, chest wall contusion</td>
<td>ECG: dysrhythmias, ST changes Patients with a normal ECG and normal hemodynamics never get dysrhythmias O2: Antidysrhythmic agents Analgesia</td>
</tr>
</tbody>
</table>

Other Potentially Life-Threatening Injuries Related to the Chest

Penetrating Neck Trauma
- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR
Airway Injuries
- always maintain a high index of suspicion
- larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
  - triad: hoarseness, subcutaneous emphysema, palpable fracture
  - other symptoms: hemoptysis, dyspnea, dysphonia
- investigations: CXR, CT scan, arteriography (if penetrating)
- management
  - airway: manage early because of edema
  - C-spine may also be injured, consider mechanism of injury
  - surgical: tracheotomy vs. repair
- trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intra-thoracic pressure, complaints of dyspnea, hemoptysis
  - examination: subcutaneous air, Hamman’s sign (crunching sound synchronous with heart beat)
  - CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
- management: surgical repair if >1/3 circumference

Abdominal Trauma
- two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = 2nd)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

BLUNT TRAUMA
- results in two types of hemorrhage: intra-abdominal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

History
- mechanism of injury, SAMPLE history

Physical Exam
- often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - tachycardia, tachypnea, oliguria, febrile, hypotension
  - other injuries may mask symptoms
  - serial examinations are required
- abdomen
  - inspect: contusions, abrasions, seat-belt sign, distention
  - auscultate: bruits, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG, Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

Investigations
- labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β-hCG, U/A, toxicology screen

</tbody>
</table>

Figure 6. Zones of the neck in trauma

Seatbelt Injuries May Cause
- Retroperitoneal duodenal trauma
- Intraparenchymal bowel transection
- Mesenteric injury
- L-spine injury

Indications for Foley and NG Tube in Abdominal Trauma
Foley catheter: unconscious or patient with multiple injuries who cannot void spontaneously
NG tube: used to decompress the stomach and proximal small bowel
Contraindications: facial fractures or basal skull fractures suspected

Criteria for Positive Lavage
- >10 cc gross blood
- Bile, bacteria, foreign material
- RBC count >100,000 x 106/L
- WBC >500 x 106/L
- Amylase >175 IU
imaging must be done if
- equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
- unexplained shock/hypotension
- patients have multiple traumas and must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
- fractures of lower ribs, pelvis, spine
- positive FAST

**Management**
- general: ABCs, fluid resuscitation, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

**PENETRATING TRAUMA**
- high risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

**Management**
- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds always require laparotomy

### Genitourinary Tract Injuries

- see Urology, U32

**Etiology**
- blunt trauma: often associated with pelvic fractures
  - upper tract
    - renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ureter: rare, at uretero-pelvic junction
  - lower tract
    - bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
  - penetrating trauma
    - damage to: kidney, bladder, ureter (rare), external genitalia
  - acceleration/deceleration injury
    - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
  - iatrogenic
    - ureter and urethra (from instrumentation)

**History**
- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

**Physical Exam**
- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures
**Investigations**
- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

**Management**
- urology consult
- renal
  - minor injuries: conservative management
  - bedrest, hydration, analgesia, antibiotics
- major injuries: admit
  - conservative management with frequent reassessments, serial U/A ± re-imaging
  - surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed
  - >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - ureteroureterostomy
- bladder
  - extraperitoneal
    - minor rupture: Foley drainage x 10-14 d
  - major rupture: surgical repair
- intraperitoneal
  - drain abdomen and surgical repair
- urethra
  - anterior: conservative, if cannot void, Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

---

**Orthopedic Injuries**

- see Orthopedics (see Shoulder OR10, Knee OR31, Wrist OR20, Ankle OR27)

**Goals of ED Treatment**
- diagnose potentially life/limb threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

**History**
- use SAMPLE
- mechanism of injury may be very important

**Physical Exam**
- look (inspection): “SEADS” swelling, erythema, atrophy, deformity, and skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, and subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

---

**LIFE- AND LIMB-THREATENING INJURIES**

**Table 10. Life- and Limb-Threatening Orthopedic Injuries**

<table>
<thead>
<tr>
<th>Life-Threatening Injuries (usually blood loss)</th>
<th>Limb-Threatening Injuries (usually interruption of blood supply)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major pelvic fractures</td>
<td>Fracture/dislocation of ankle (talar AVN)</td>
</tr>
<tr>
<td>Traumatic amputations</td>
<td>Crush injuries</td>
</tr>
<tr>
<td>Massive long bone injuries and associated fat emboli syndrome</td>
<td>Compartment syndrome</td>
</tr>
<tr>
<td>Vascular injury proximal to knee/elbow</td>
<td>Dislocations of knee/hip</td>
</tr>
<tr>
<td></td>
<td>Fractures above knee/elbow</td>
</tr>
</tbody>
</table>

**Open Fractures**
- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- standard of care is to secure definitive surgical management within 6 h, time to surgery may vary from case-to-case
Vascular Injuries
- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

Compartment Syndrome
- when the intracompartmental pressure within an anatomical area (e.g. forearm or lower leg) exceeds the capillary perfusion pressure, eventually leading to muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - tense compartment
  - look for “the 6 Ps” (note: radial pulse pressure is 120/80 mmHg while capillary perfusion pressure is 30 mmHg, seeing any of the 6ps indicates advanced compartment syndrome, therefore do not wait for these signs to diagnose and treat)
- requires prompt decompression: remove constrictive casts, dressings; emergent fasciotomy may be needed

UPPER EXTREMITY INJURIES
- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
  - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopedics
  - with forceful injury, look for fracture
- Colles’ fracture
  - distal radius fracture with dorsal displacement from “Fall on Outstretched Hand” (FOOSH)
  - AP film: shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with orthopedics or immediate orthopedic referral if complicated fracture
  - if involvement of articular surface, emergent orthopedic referral
- scaphoid fracture
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
  - risk of AVN of scaphoid if not immobilized
  - outpatient orthopedics follow-up

LOWER EXTREMITY INJURIES
- ankle and foot fractures
  - see Ottawa Ankle and Foot Rules
- knee injuries
  - see Ottawa Knee Rules
  - avulsion of the base of 5th metatarsal
    - occurs with inversion injury
    - supportive tensor or below knee walking cast for 3 wk
  - calcaneal fracture
    - associated with fall from height
    - associated injuries may involve ankles, knees, hips, pelvis, lumbar spine

A knee x-ray examination is required only for acute injury patients with one or more of:
- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)
Wound Management

Goals of ED Treatment
- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration (history and physical)
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

Tetanus Prophylaxis
- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

Table 11. Guidelines for Tetanus Prophylaxis for Wounds

<table>
<thead>
<tr>
<th>Vaccination History</th>
<th>Clean, minor wounds</th>
<th>All other wounds*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unknown or fewer than 3 doses</td>
<td>Tdap or Td†</td>
<td>TIG</td>
</tr>
<tr>
<td>3 or more doses</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns, and frostbite.
†Tdap is preferred to Td for adults who have never received Tdap. Single antigen tetanus toxoid (TT) is no longer available in the United States.
‡Yes, if more than ten years since the last tetanus toxoid-containing vaccine dose.
§Yes, if more than five years since the last tetanus toxoid-containing vaccine dose.

Bruises
- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

Abrasions
- partial to full thickness break in skin
- management
  - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antiseptic ointment (Polysporin® or Vaseline®) for 7 d for facial and complex abrasions
  - tetanus prophylaxis

Lacerations
- see Plastic Surgery, PL8
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury

Acute Treatment of Contusions
RICE
- Rest
- Ice
- Compression
- Elevation

High Risk Factors for Infection
Wound Factors
- Puncture wounds
- Crush injuries
- Wounds >12 h old
- Hand or foot wounds
- Immunocompromised

Patient Factors
- Age >50 yr
- Prosthetic joints or valves (risk of endocarditis)

Suture Use and Duration

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

N.B. Patients on steroid therapy may need sutures for longer periods of time
• physical exam
  ■ think about underlying anatomy
  ■ examine tendon function actively against resistance and neurovascular status distally
  ■ clean and explore under local anesthetic; look for partial tendon injuries
  ■ x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radioopaque), or if suspect intra-articular involvement
• management
  ■ disinfect skin/use sterile techniques
  ■ irrigate copiously with normal saline
  ■ analgesia ± anesthetics
  ■ maximum dose of lidocaine
    • 7 mg/kg with epinephrine
    • 5 mg/kg without epinephrine
  ■ in children, topical anesthetics such as LLET (lidocaine, epinephrine, and tetracaine), and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
  ■ secure hemostasis
  ■ evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
  ■ ± prophylactic antibiotics (consider for animal/human bites, intra-oral lesion, or puncture wounds to the foot)
  ■ suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury, or retained foreign body
  ■ take into account patient and wound factors when considering suturing
  ■ advise patient when to have sutures removed
  ■ cellulitis and necrotizing fasciitis (see Plastic Surgery, PL15)

### Approach to Common ED Presentations

## Abdominal Pain

### Table 12. Selected Differential Diagnosis of Abdominal Pain

<table>
<thead>
<tr>
<th></th>
<th>Emergent</th>
<th>Usually Less Emergent</th>
</tr>
</thead>
<tbody>
<tr>
<td>GI</td>

<tr>
<td>Other</td>
<td>Significant trauma, acute angle closure glaucoma</td>
<td>Abdominal wall injury, herpes zoster, psychiatric, abscess, herna, mesenteric adenitis</td>
</tr>
</tbody>
</table>

• differential can be focused anatomically by location of pain: RUQ, LUQ, RLQ, LLQ, epigastric, periumbilical, diffuse

### History

• pain: OPQRST
• review symptoms from GU, gynecological, GI, respiratory, and CV systems
• abdominal trauma/surgeries most recent colonoscopy

### Physical Exam

• vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

### Investigations

• ABCs, do not delay management and consultation if patient unstable
• CBC, electrolytes, glucose, BUN/Cr, U/A ± liver enzymes, LFTs, lipase, β-hCG, ECG, troponins, ± VBG/lactate
• AXR: look for calcifications, free air, gas pattern, air fluid levels
• CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
• U/S: biliary tract, ectopic pregnancy, AAA, free fluid
• CT: trauma, AAA, pancreatitis, nephro-/uroolithiasis, appendicitis, and diverticulitis

Early wound irrigation and debridement are the most important factors in decreasing infection risk

Where NOT to use local anesthetic with epinephrine:
- Ears, Nose, Fingers, Toes, and Penis

Alternatives to Sutures
- Tissue glue
- Steristrips®
- Staples

Be vigilant: very young, elderly, alcoholics, immunosuppressed patients often present atypically
Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have an increased level of suspicion for an intra-abdominal process in these individuals

Unstable patients should not be sent for imaging

If elevated AST and ALT
Think hepatocellular injury
AST > ALT: alcohol-related
ALT > AST: viral, drug, toxin

If elevated ALP and GGT
Think biliary tree obstruction
Management
• NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
• growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
• consult as necessary: general surgery, vascular surgery, gynecology, etc.

Disposition
• admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
• discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

Acute Pelvic Pain

Etiology
• gynecological
  - second most common gynecological complaint (after vaginal bleeding)
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID, endometriosis
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse
• non-gynecological (see causes of lower abdominal pain above)

History and Physical Exam
• pain: OPQRST
• associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel or bladder symptoms
• pregnancy and sexual history
• vitals
gynecological exam: assess for cervical motion tenderness/"chandelier sign" (suggests PID)
• abdominal exam

Investigations
• β-hCG for all women of childbearing age
• CBC and differential, electrolytes, glucose, Cr, BUN, G&S, PTT/INR
• vaginal and cervical swabs for C&S during physical exam
• pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
• Doppler flow studies for ovarian torsion

Management
general: analgesia, determine if admission and consults are needed
• specific
  - ovarian cysts
    • unruptured or ruptured and hemodynamically stable: analgesia and follow-up
    • ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  - PID: requires broad spectrum antibiotics

Disposition
• referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
• admission: patients requiring surgery, IV antibiotics/pain management
• discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

Altered Level of Consciousness

Definitions
• altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see Psychiatry, PS19)
  - dementia (see Psychiatry, PS20)
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness
MANAGEMENT OF ALTERED LOC

History
- obtain collateral from family, friends, police, paramedics, old chart, MedicAlert\textsuperscript{t} bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/ischemia or cardiac cause
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode, depression, overdose)

Physical Exam
- ABCs, vitals including temperature, cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes ("PEARL" pupils equal and reactive to light)
  - use the GCS to evaluate LOC (see Initial Patient Assessment/Management, ER2)

Investigations
- blood work
  - rapid blood sugar, CBC, electrolytes, Cr, BUN, LFTs, glucose, serum osmolality, VBG, PT/PTT/INR, troponins
  - serum EtOH, acetaminophen, and salicylate levels
- imaging
  - CXR, CT head
- other tests
  - ECG, U/A, UTox

Diagnosis
- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - one ampule D50W IV if low blood sugar on finger-prick
  - naloxone 0.4-2 mg IV or IM if opiate overdose suspected
- distinguish between structural and toxic/metabolic coma
  - structural coma
    - pupils, extraocular movements, and motor findings, if present, are usually asymmetric
    - look for focal or lateralizing abnormalities
  - toxic/metabolic coma
    - dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 13)
    - extraocular movements and motor findings are symmetric or absent
- essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")
Table 13. Toxic-Metabolic Causes of Fixed Pupils

<table>
<thead>
<tr>
<th>Dilated</th>
<th>Dilated to Normal</th>
<th>Constricted</th>

</tbody>
</table>

Disposition
- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

Chest Pain

Table 14. Differential Diagnosis for Chest Pain

<table>
<thead>
<tr>
<th>Emergent</th>
<th>Usually Less Emergent</th>

</tr>
<tr>
<td>GI</td>
<td>Esophageal rupture, pneumomediastinum</td>
</tr>
<tr>
<td>MSK</td>
<td></td>
</tr>
<tr>
<td>Other</td>
<td></td>
</tr>
</tbody>
</table>

History and Physical Exam
- OPQRST, previous episodes and change in pattern
- cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
- vitals, cardiac, respiratory, peripheral vascular, abdominal exams

Investigations
- CBC, electrolytes, Cr, BUN, glucose, PTT/INR
- ECG: always compare with previous; may be normal in up to 50% of PE and acute MI
- CXR: compare with previous

Management and Disposition
- ABCs, O2, cardiac monitors, IV access
- treat underlying cause and involve consultants as necessary
- consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up and instruct to return if SOB or increased chest pain develops

Life-Threatening Causes of Chest Pain
- PET MAP
  - PE
  - Esophageal rupture
  - Tamponade
  - MI/angina
  - Aortic dissection
  - Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of BP

Angina Characteristics
1. Retrosternal location
2. Provoked by exertion
3. Relieved by rest or nitroglycerin

Risk for CAD
- 3/3 = “typical angina” - high risk
- 2/3 = intermediate risk for women >50 yr, all men
- 1/3 = Intermediate risk in men >40 yr, women >60 yr
<table>
<thead>
<tr>
<th>Chest Pain Diagnoses</th>
<th>Classic History</th>

**Table 15. Comparison of Chest Pain Diagnoses**

- **ACLS** more likely to be atypical in females, diabetics, and > 80 yr. Anginal equivalents include dyspnea, diaphoresis, fatigue, non-retrosternal pain
- **Signs of PE on CXR**
  
  - Westermark’s sign: abrupt tapering of a vessel on chest film
  - Hampton’s hump: a wedge-shaped infiltrate that abuts the pleura
  - Effusion, pleural effusion, or infiltrates 50% normal

- **It is important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations)**

- **Tracheal deviation is away from tension or towards non-tension pneumothorax**

**Addition of Clopidogrel to Aspirin® and fibrinolytic Therapy for Myocardial Infarction with ST-Segment Elevation**

*NEJM 2005;352:1179-1191*

**Purpose**: To assess the benefit of adding clopidogrel to Aspirin® and fibrinolytic therapy in ST-elevation MI.

**Study Characteristics**: Double-blind, RCT following intention-to-treat analysis, with 3,491 patients and clinical follow-up at 30 d.

**Participants**: Individuals presenting within 12 h of onset of ST-elevation MI (mean age 57, 80.3% male, 50.3% smokers, 9.1% previous MI). Those presenting after 12 h, age > 75, or with previous CABG, were excluded.

**Intervention**: Clopidogrel (300 mg loading dose followed by 75 mg OD until day of angiogram) or placebo, in addition to Aspirin®, a fibrinolytic agent, and heparin when appropriate.

**Primary Outcome**: Composite of occluded infarct-related artery on angiography (thrombolysis in MI flow grade 0 or 1), or death or recurrent MI prior to angiography.

**Results**: Ratio of primary end point was 21.1% in the placebo group and 15.0% in the clopidogrel group (95% CI 24-47%). Among the individual components of the primary end point, clopidogrel had a significant effect on the rate of an occluded infarct-related artery and the rate of recurrent MI, but no effect on the rate of death from any cause. At 30 d clinical follow-up, there was no difference in rate of death from cardiovascular causes, a significant reduction in the odds of recurrent MI, and a non-significant reduction in recurrent ischemia with need for urgent revascularization. The rates of major bleeding and intracranial hemorrhage were similar between the two groups.

**Conclusion**: Addition of clopidogrel improves the patency rate of infarct-related arteries and reduces ischemic complications, both of which are associated with improved long-term survival after MI. The trial was not powered to detect a survival benefit, and none was seen.

**Immediate Treatment of Acute M**

- **BEMOAN**
  - β-blocker
  - Enoxaparin
  - Morphine
  - Oxygen
  - ASA
  - Nitroglycerin

**Headache**

- **See Neurology, N44**

**Etiology**

- **The common**
  - Common migraine (without aura)/classic migraine (with aura)
    - Common: unilateral, throbbing, aggravated by activity, moderate/severe, N/V, photo-/ phonophobia
    - Classic: varied aura symptoms, e.g. flashing lights, pins and needles (paresthesia), loss of vision, dysarthria
    - Abortive treatment: fluids, NSAIDs, antiemetics, antiepileptic drugs, vasoactive medications
    - Family doctor to consider prophylactic treatment
  - Tension/muscular headache
    - Mild-moderate headache with gradual onset lasting minutes to days
    - Bilateral-frontal or nuchal-occipital
    - Increased with stress, sleep deprivation
    - Treatment: modify stressor(s), local measures, NSAIDs, tricyclic antidepressants

- **The deadly**
  - Subarachnoid hemorrhage (SAH) (see Neurosurgery, NS17)
  - Sudden onset, “worst headache of life” maximum intensity within minutes
  - Increased pain with exertion, N/V, meningeal signs
  - Diagnosis
    - New generation CT 100% sensitive within 6h of onset (hyperattenuating signal around Circle of Willis)
    - LP if suspected SAH and normal CT after 6h
    - Management: urgent neurosurgery consult
  - Increased ICP
    - Worse in morning, when supine or bending down, with cough or valsalva
    - Physical exam: neurological deficits, cranial nerve palsies, papilledema
  - Diagnosis: CT head
  - Management: consult neurosurgery

**Common Therapeutic Approach to Severe Migraine**

- **1L bolus of NS**
- **Prochlorperazine 10 mg IV**
- **Diphenhydramine 25 mg IV**
- **Ketorolac 30 mg IV**
- **Dexamethasone 10 mg IV**
- Other options include haloperidol, metoclopramide, ergotamine, sumatriptan, analgesics

**Ottawa SAH Rule**

- **1L bolus of NS**
- **2 episodes over 6h**
- **Larger than 0.5 cm**
- **Cranial nerve palsies**
- **Increased ICP**
- **Worsened by neck flexion**
- **History of recurrent headaches**

- Use for alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h
- Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumours, or history of recurrent headaches (>3 episodes over the course of ≥6 mo)
- Investigate if ≥2 high-risk variables present:
  - Age ≥60 yr
  - Neck pain or stiffness
  - Witnessed loss of consciousness
  - Onset during exertion
  - Thunderclap headache (instantly peaking pain)
  - Limited neck flexion on examination
- Subarachnoid hemorrhage can be predicted with 100% sensitivity using this rule.
Disposition
- admission: if underlying condition is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

**Joint and Back Pain**

**JOINT PAIN** (see **Rheumatology, RH3**)
- rule out life threatening causes: septic joint (see **Orthopedics, OR10**)  

**History and Physical Exam**
- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: prolonged morning stiffness, stiffness and pain ease through the day, mid-day fatigue, soft tissue swelling
- non-inflammatory symptoms: stiffness short lived after inactivity, short duration stiffness in the morning, pain increases with activity
- assess ROM, presence of joint effusion, warmth
- assess for localized joint pain, erythema, warmth, swelling with pain on active ROM, inability to bear weight, fever; may indicate presence of septic joint

**Investigations**
- blood work: CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate
- joint x-ray ± contralateral joint for comparison
- bedside U/S to identify effusion
- test joint aspirate for: WBC, protein, glucose, Gram stain, crystals

**Management**
- septic joint: IV antibiotics ± joint decompensation and drainage
- antibiotics can be started empirically if septic arthritis cannot be ruled out
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
- do not use allopurinol, as it may worsen acute attack
- acute polyarthritides: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritides: NSAIDs, acetaminophen
- soft tissue pain: allow healing with enforced rest ± immobilization
- non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
- pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

**BACK PAIN** (see **Family Medicine, FM38**)
- rule out vascular emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed
- rule out spinal emergencies using red flags (see sidebar): osteomyelitis, cauda equina, epidural abscess or hematoma
- evaluate risk for fracture (osteoporosis, age), infection (IV drug user, recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors)
- typical benign back pain is moderate, dull, aching, worse with movement or cough
- palpate spine for bony tenderness; precordial, respiratory, abdominal and neurological exams guided by history
- reserve imaging for suspicion of emergencies, metastases, and patients at high risk of fracture, infection, cancer, or vascular causes

---

**ER24 Emergency Medicine Toronto Notes 2017**

- meningitis (see **Infectious Diseases, ID18**)
  - flu-like symptoms (fever, N/V, malaise), meningeal signs, petechial rash
  - altered LOC and confusion
  - rule out increased ICP: if CT head or normal mental status, no neurological signs and no papilledema, then do LP for diagnosis
  - treatment: early empiric antibiotics ± acyclovir, steroid therapy
- temporal arteritis (causes significant morbidity, blindness) (see **Ophthalmology, OP35**)
  - vasculitis of large and mid-sized arteries, gender 3:1 F:M, most commonly age >70 yr
  - headache, scalp tenderness, jaw claudication, arthralgia, myalgia, fever, malaise or weight loss
  - temporal artery tender on palpation, relative afferent pupillary defect (RAPD), optic disc edema on fundoscopy
  - labs: elevated ESR, CRP
- temporal artery biopsy is gold standard for diagnosis
- associated with polymyalgia rheumatica
- treatment: high-dose steroids immediately if suspected, no need to hold treatment until pathology results

---

**Joint Pain**

**Which Patients can Safely Undergo Lumbar Puncture Without Screening CT?**

Arch Intern Med 1999; 159(22):2681-2685

**Study:** a prospective study to identify patients who can safely undergo LP without CT

**Population:** 113 patients, age >10 yr, needing urgent LP as determined by ED physician

**Intervention:** all patients were examined before CT by staff physicians. Physician examiners involved in the study then recorded the presence or absence of 10 clinical findings and answered 6 questions regarding the patient’s past medical history and recorded then perceived likelihood that LP would be contraindicated

**Main Outcome Measure:** results of non-contrast CTs interpreted by staff radiologist

**Results:** 2.7% of patients had lesions on CT that contraindicated LP. Overall, clinical impression had the highest predictive value in identifying patients with contraindications to LP (+LR 14.0, -LR 0.05). When used in aggregate—alternating mental, local neurologic examination and papilledema were three statistically significant identified predictors of new intracranial lesions (+LR 2.7, -LR 1.0). When used alone these predictors were inadequate

**Conclusion:** given the low prevalence of lesions that contraindicate LP, screening CT safely to establish the safety of LP provides minimal extra information. Physicians can rely on their clinical judgement and the three predictors.

---

**Meningitis**

- Do not delay IV antibiotics for LP
- Deliver first dose of dexamethasone within 0 hr or before first dose of antibiotic therapy

---

**CT Head within 6 h is 100% Sensitive for Diagnosis of Subarachnoid Hemorrhage (SAH)**

BMJ 2012;344(34427)

**Study:** a prospective multicentre cohort study was conducted in 11 tertiary care emergency departments across Canada to measure the sensitivity of CT head in the evaluation of ED patients for SAH

**Population:** neurologically intact adults who presented neurologically intact adults who presented

**Design:** patients were deemed positive for SAH if there was subarachnoid blood on CT, xanthochromia in the CSF, or evidence of SAH in the subarachnoid space on fundoscopy or if there was an abnormality on CT that was subarachnoid hemorrhage

**Results:** of 919 patients with non-contrast CT performed, 877 patients had CT performed within 6 h of headache. Of these patients, 125 had SAH and 557 had no other evidence of SAH

**Main Outcome Measure:** results of CT interpreted by staff radiologist

**Results:** sensitivity of SAH detection was 93.5% with specificity 99.9% and positive predictive value 93.5%

**Conclusion:** CT is extremely sensitive in identifying subarachnoid hemorrhage when it is carried out within 6 h of headache onset
Management
• treat underlying cause
• lumbosacral strain and disc herniation: analgesia and continue daily activities as much as tolerated; discuss red flags and organize follow-up
• spinal infection: early IV antibiotics and ID consultation
• cauda equina: dexamethasone, early neurosurgical consultation

Seizures
• see Neurology, N18

Definition
• paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
• status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness (life threatening)

Categories
• generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
• partial seizure (focal): simple partial, complex partial
• causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hyper-/hypoglycemia, hypo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
• differential diagnosis: syncope, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy, myoclonus

History
• from patient and bystander: flaccid and unconscious, often with deep rapid breathing
• preceding aura, rapid onset, loss of bladder/bowel control, tongue-biting (sides of the tongue)
• length of seizure and post-ictal symptoms

Physical Exam
• injuries to head and spine and bony prominences (e.g. elbows), tongue laceration, aspiration, urinary incontinence

Table 17. Concurrent Investigation and Management of Status Epilepticus

<table>
<thead>
<tr>
<th>Timing</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediate</td>
<td>Protect airway with positioning; intubate if airway compromised or elevated ICP. Monitor: vital signs, ECG, oximetry; bedside blood glucose. Establish IV access. Benzodiazepine - IV lorazepam 0.1 mg/kg up to 4 mg/dose at 2 mg/min preferred over IV diazepam 0.15 mg/kg up to 10 mg/dose at 5 mg/min; repeat at 5 min if ineffective. Fluid resuscitation. Give 50 ml 50% glucose (preceded by thiamine 100 mg IM in adults). Obtain blood samples for glucose, CBC, electrolytes, Ca++, Mg++, toxins, and antiepileptic drug levels; consider prolactin, β-hCG. Vasopressor support if sBP &lt;90 or MAP &lt;70 mmHg.</td>
</tr>
<tr>
<td>Urgent</td>
<td>Establish second IV line, urinary catheter. If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 minutes after loading infusion. If seizure resolves, antiepileptic drug still required to prevent recurrence. EEG monitoring to evaluate for non-convulsive status epilepticus.</td>
</tr>
<tr>
<td>Refractory</td>
<td>If status persists after maximum doses above, consult ICU and start one or more of: Phenobarbital 20 mg/kg IV at 50 mg/min. Midazolam 0.2 mg/kg IV loading dose and 0.05-0.5 mg/kg/h. Propofol 2-5 mg/kg IV loading dose then 2-10 mg/kg/h.</td>
</tr>
<tr>
<td>Post-Seizure</td>
<td>Investigate underlying cause: consider CT, LP, MRI, intracranial pressure monitoring.</td>
</tr>
</tbody>
</table>

Disposition
• decision to admit or discharge should be based on the underlying disease process identified
  • if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
  • first-time seizure patients being discharged should be referred to a neurologist for follow-up
  • admitted patients should generally have a neurology consult
  • patient should not drive until medically cleared (local regulations vary)
  • complete notification form to appropriate authority regarding ability to drive
  • warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)
Shortness of Breath

- see Respirology, R3 and Cardiology and Cardiac Surgery, C5

<table>

</tr>
<tr>
<td>Neuromuscular</td>
</tr>
<tr>
<td>Other</td>
</tr>
</tbody>
</table>

History and Physical Exam
- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
  - wheeze and stridor (airway) vs. crackles (parenchymal), JVP, and murmurs

Investigations
- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - Wells scores to consider appropriateness of d-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (i.e. PE)

Management of Life-Threatening Dyspnea NYD
- see Primary and Secondary Surveys, ER2-3
- treat underlying cause

Disposition
- the history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
  - consider intubation in CO₂ retainer (e.g. COPD)
- if discharging, organize follow-up and educate regarding signs to return to hospital

Syncope

Definition
- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system hypoperfusion

Etiology
- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)
History
- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation
- distinguish between syncope and seizure (see Neurology, N19)
  - some patients may have myoclonic jerks with syncope – NOT a seizure
    - signs and symptoms during presyncope, syncope, and postsyncope
    - past medical history, drugs
    - think anatomically in differential; pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
  - syncope is accompanied by chest pain

Physical Exam
- postural BP and HR
- cardiovascular, respiratory, and neurological exam
- examine for signs of trauma caused by syncopal episode

Investigations
- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval, Brugada Syndrome, RV strain), bedside glucose
- blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, Ca²⁺, Mg²⁺, β-hCG, D-dimer
- consider toxicology screen

Management
- ABCs, IV, O₂, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

Disposition
- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate the patient for fitness to drive or work
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

Epidemiology
- 1 in 4 women and 1 in 10 men will be sexually assaulted in their lifetime; only 7% are reported

General Approach
- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (legally required)

History
- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
  - gravidity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
  - medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

Physical Exam
- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)
• pelvic exam and specimen collection
  ■ ideally before urination or defecation
  ■ examine for seminal stains, hymen, signs of trauma
  ■ collect moistened swabs of dried seminal stains
  ■ pubic hair combings and cuttings
  ■ speculum exam
  ■ lubricate with water only
  ■ vaginal lacerations, foreign bodies
  ■ Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
  ■ posterior fornix secretions if present or aspiration of saline irrigation
  ■ immediate wet smear for motile sperm
  ■ air-dried slides for immotile sperm, acid phosphatase, ABO group
  ■ fingernail scrapings and saliva sample from victim

**Investigations**
- VDRL: repeat in 3 mo if negative
- serum β-hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

**Management**
- involve local/regional sexual assault team
- medical
  ■ suture lacerations, tetanus prophylaxis
  ■ gynecology consult for foreign body, complex lacerations
  ■ assumed positive for gonorrhea and chlamydia
  ■ management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 7 d) and cefixime 800 mg PO x 1 dose (alt: ceftriaxone 250 mg IM x 1 dose)
  ■ may start prophylaxis for hepatitis B and HIV
  ■ pre and post counselling for HIV testing
  ■ pregnancy prophylaxis offered
    ■ levonorgestrel 0.75 mg PO STAT, repeat within 12 h (Plan B’)
- psychological
  ■ high incidence of psychological sequelae
  ■ have victim change and shower after exam completed

**Disposition**
- discharge if injuries/social situation permit
- follow-up with physician in rape crisis centre within 24 h
- best if patient does not leave ED alone

**DOMESTIC VIOLENCE**
- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
- suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
- somatic symptoms (chronic and vague complaints)
- psychosocial symptoms
  ■ clinician impression (your ‘gut feeling’, e.g. overbearing partner that won’t leave patient’s side)
- if disclosed, be supportive and assess danger
- patient must consent to follow-up investigation/reporting (unless for children)

**Management**
- treat injuries and document findings
- ask about sexual assault and children at home (encourage notification of police)
- safety plan with good follow-up with family doctor/social worker

---

**Medical Emergencies**

**Anaphylaxis and Allergic Reactions**

**Etiology**
- anaphylaxis is an exaggerated immune mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
- allergic (re-exposure to allergen)
- non-allergic (e.g. exercise induced)
Diagnostic Criteria
- anaphylaxis is highly likely with any of
  1. acute onset of an illness (min to hrs) with involvement of the skin, mucosal tissue and at least one of
     • respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
     • hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. two or more of the following after exposure to a LIKELY allergen for that patient (min to hrs)
     • involvement of the skin-mucosal tissue
     • respiratory compromise
     • hypotension or associated symptoms
     • persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. hypotension after exposure to a KNOWN allergen for that patient (min to hrs)
     • management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
     • life-threatening differentials for anaphylaxis include asthma and septic shock
     • angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

Management
- moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
  • epinephrine (1:1000) 0.3-0.5 mg IM
  • antihistamines: diphenhydramine (Benadryl®) 25-50 mg IM
  • salbutamol (Ventolin®) 1 cc via MDI
- severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
  • –ABCs, may need ETT due to airway edema
  • epinephrine (1:1000) 0.1-0.3 mg IV (or via ETT if no IV access) to start, repeat as needed
  • antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
  • steroids: hydrocortisone (Solucortef®) 100 mg IV (~1.5 mg/kg) or methylprednisolone (Solumedrol®) 1 mg/kg IV q6h x 24 h
  • large volumes of crystalloid may be required

Disposition
- monitor for 4-6 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 48 h later, patient may need to be supervised
- educate patient on avoidance of allergens
- medications
  • H2 antagonist (cetirizine 10 mg PO OD or Benadryl® 50 mg PO q4-6h x3d)
  • H2 antagonist (ranitidine 150 mg PO OD x3d)
  • corticosteroid (prednisone 50 mg PO OD) x5d to prevent secondary reaction

Asthma
- see Respirology R7
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

History and Physical
- find cause of asthma exacerbation (viral, environmental, etc.)
- history of asthma control; severity of exacerbations (ICU, intubation history)
- signs of respiratory distress
- vitals, specifically O2

Investigations
- peak flow meter
- ± ABG if in severe respiratory distress
- CXR if diagnosis in doubt to rule out pneumonia, pneumothorax, etc.

</tbody>
</table>

Disposition
- discharge safe in patients with FEV₁ or PEF > 60% predicted, and may be safe if FEV₁ or PEF 40-60% predicted based on patient’s risk factors for recurrence of severe attack
- risk factors for recurrence: frequent ED visits, frequent hospitalizations, recent steroid use, recent exacerbation, poor medication compliance, prolonged use of high dose β-agonists
- β-agonist MDI with aerochamber 2-4 puffs q2-4h until symptoms controlled, then prn
- initiate inhaled corticosteroids with aerochamber if not already prescribed
- if moderate to severe attack, administer prednisone 30-60 mg/d for 7 d with no taper
- counsel on medication adherence and educate on use of aerochamber
- follow-up with primary care physician or asthma specialist

Cardiac Dysrhythmias

- see Cardiology and Cardiac Surgery, C16

Bradydysrhythmias and AV Conduction Blocks
- AV conduction blocks
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
  - atropine and transcutaneous pacemaker (atropine with caution)
  - if transcutaneous pacemaker fails consider dopamine, epinephrine IV
  - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate <60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, CCBs)
  - treat if symptomatic (hypotension, chest pain)
    - acute: atropine ± transcutaneous pacing
    - sick sinus: transcutaneous pacing
    - drug induced: discontinue/reduce offending drug, consider antidotes

Supraventricular Tachydysrhythmias (narrow QRS)
- sinus tachycardia (rate >100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider β-blocker if symptomatic
- regular rhythm (i.e. not sinus tachycardia)
  - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
  - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
    - monitor for recurrence
    - treat recurrence with adenosine or longer acting medications

If the patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion
• rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
  • rate control (diltiazem, β-blockers) and consult cardiology
• irregular rhythm
  • probable Afib, atrial flutter, or multifocal atrial tachycardia
  • rate control (diltiazem, β-blockers)

**Atrial Fibrillation**
• most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
• etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
• treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
• decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
• acute management
  • if unstable: immediate synchronized cardioversion
  • if onset of Afib is >48 h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion, or do transesophageal echocardiogram to rule out clot
  • if onset <48 h or already anticoagulated: mayo cardiover, electrical cardioversion: synchronized direct current (DC) cardioversion
  • chemical cardioversion: procainamide, flecainide, propafenone
• long-term management: rate or rhythm control, consider anticoagulation (CHADS2 score, see Cardiology and Cardiac Surgery, C20)

**Ventricular Tachydysrhythmias (wide QRS)**
• VTach (rate usually 140-200 bpm)
  • definition: 3 or more consecutive ventricular beats at >100 bpm
  • etiology: CAD with MI is most common cause
  • treatment: sustained VTach (>30 s) is an emergency
    • hemodynamic compromise: synchronized DC cardioversion
    • no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
• VFib: call a code blue, follow ACLS for pulseless arrest
• Torsades de pointes
  • looks like VTach but QRS ‘rotates around baseline’ with changing axis and amplitude (twisted ribbon)
  • etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  • treatment
    • IV Mg₂⁺, temporary overdrive pacing, isoproterenol
    • correct cause of prolonged QT

**Acute Exacerbation of COPD (AECOPD)**
• for chronic management of COPD see Respirology, R9
• progressive development of irreversible airway obstruction, typically caused by smoking

**History and Physical Exam**
• cardinal symptoms of AECOPD: increased dyspnea, increased coughing frequency or severity, increased sputum volume or purulence
• triggers: virus, pneumonia, urinary tract infection, PE, CHF, MI, drugs
• characterize previous episodes and hospitalizations, smoking history
• vital signs, level of consciousness, signs of respiratory distress, respiratory exam

**Investigations**
• CBC, electrolytes, ABG, CXR, ECG
• PFTs are NOT useful in managing acute exacerbations

**Management**
• oxygen: keep O₂ sat 88-92% (be aware when giving O₂ to chronic hypercapnic/C0₂: retainers but do not withhold O₂ if hypoxic)
• bronchodilators: short-acting β-agonist (Salbutamol 4-8 puffs via MDI with spacer q15min x3 prn) ± short-acting anticholinergic (Ipratropium 4-8 puffs via MDI q15min x3 prn)
• steroids: prednisone 40-60 mg PO for 7-14 d, or methylprednisolone 125 mg IV bid-qid if severe exacerbation, or unable to take PO
• antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (given if all 3 cardinal symptoms present or 2 cardinal symptoms with increased sputum purulence or mechanical ventilation)
• ventilation: apply NIPPV (CPAP or BiPAP) if severe distress or signs of fatigue, arterial pH <7.35, or hypercapnic
• if life-threatening, ICU admission for intubation and ventilation (chance of ventilation dependency)

**Disposition**
• no guidelines for admission - based on clinical judgement and comorbidities
• lower threshold to admit if comorbid illness (diabetes, CHF, CAD, alcohol abuse)
• if discharging, use antibiotics, tapering steroids, up to 4-6 puffs qid of Ipratropium and salbutamol and organize follow-up

**Causes of Atrial Fibrillation**
- C (“sea”) PIRATES
  - CHF, Cardiomyopathy
  - Pulmonary embolism
  - Ischemic heart disease
  - Rheumatic or valvular disease
  - Anemia
  - Thyroid
  - EtOH
  - Hypertension
  - Sick Sinus, Stress - surgery, sepsis

**Physical Exam Findings in COPD**
- Wheeze
- Maximum laryngeal height ≤4 cm
- Forced expiratory time ≤6 s
- Decreased breath sounds
- Decreased cardiac dullness

**Need to Rule Out with COPD Exacerbation**
- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE
# Acute Decompensated Heart Failure (ADHF)

- for chronic management of CHF see Cardiology and Cardiac Surgery, C36

## Etiology
- Causes of CHF: decreased myocardial contractility (ischemia, infarction, cardiomyopathy, myocarditis), pressure overload states (HTN, valve abnormalities, congenital heart disease), restricted cardiac output (myocardial infiltrative disease, cardiac tamponade)
- Precipitants of acute decompensation of CHF
  - cardiac (ischemia, infarction, arrhythmia - Afib)
  - medications (beta-blockers, CCBs, NSAIDs, steroids, non-compliance)
  - dietary (increased sodium and/or water intake)
  - high output (anemia, infection, pregnancy, hyperthyroid)
  - other (renal failure, hypertensive crisis, iatrogenic fluid overload - blood transfusions or IV fluids)

## Presentation
- left-sided heart failure
  - dyspnea, SOB, orthopnea, PND, nocturia, fatigue, altered mental status, presyncope/syncope, anemia, systemic hypotension
  - hypoxia, decreased air entry to lungs, crackles, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation and positive AJR, ascites, hepatomegaly
- patients often present with a combination of right-sided and left-sided symptoms

## Investigations
- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide (BNP/NT-proBNP/Brain natriuretic peptide (BNP/NT-proBNP))
- CXR: most useful test (see sidebar)
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion), LVH, atrial enlargement, conduction abnormalities
- ABG: if severe or refractory to treatment
  - hypoxemia, hypercapnia and acidosis are signs of severe CHF
- echocardiogram: not usually used in emergency evaluation, previous results may aid in diagnosis
- rule out serious differentials such as PE, pneumothorax, pneumonia/empyema, AECOPD

## Management
- ABCs, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter (to follow effectiveness of diuresis)
- 100% O₂: by mask
- if poor response, may require BiPAP or intubation
- drugs
  - diuretic (if volume overloaded): Furosemide 40–80 mg IV
  - vasodilators (if sBP > 100): Nitroglycerin 0.3 mg SL q30min prn ± topical Nitrodur patch (0.4-0.8 mg/h)
  - if not responding or signs of ischemia (angina): Nitroglycerine 10–20 µg/min IV, titrate to response
  - if severe or refractory hypertension: Nitroprusside 0.5 µg/kg/min, titrate to response
  - inotropes/vasopressors (if sBP < 90)
    - without signs of shock: Dobutamine 2.5 µg/kg/minute IV, titrate up to sBP > 90 mmHg
    - with signs of shock: Dopamine 5–10 µg/kg/minute IV, titrate up to sBP > 90 mmHg
  - treat precipitating factor - e.g. rate control (beta-blocker, CCB) or rhythm-control (electrical or chemical cardioversion) if new Afib
  - cardiology or medicine consult

### Venous Thromboembolism (VTE)

- see Respirology, R20

## Risk Factors
- Virchow's triad: alterations in blood flow (venous stasis), injury to endothelium, hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors (see sidebar)

## Deep Vein Thrombosis (DVT)

### Presentation
- calf pain, unilateral leg swelling/erythema/edema, palpable cord along the deep venous system on exam; can be asymptomatic
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed
**Investigations**
- use Wells’ criteria for DVT to guide investigations (Figure 12)
- D-dimer is only useful at ruling out a DVT if it is negative in low to moderate risk patients (highly sensitive)
  - high risk of false positives in: elderly, infection, recent surgery, trauma, hemorrhage, late in pregnancy, liver disease, cancer
- U/S has high sensitivity & specificity for proximal clot but only 73% sensitivity for calf DVT (may need to repeat in 1 wk)
  - if positive – treat for DVT regardless of risk
  - if negative and low risk – rule out DVT
  - if negative and moderate to high risk – repeat U/S in 5-7 days to rule out DVT

**Management**
- LMWH unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24h or enoxaparin 1.5 mg/kg SC q24h
  - warfarin started at same time as LMWH (5 mg PO OD initially followed by dosing based on INR)
  - LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
  - rivaroxaban can be used in acute management of symptomatic DVT
    - 15 mg PO bid for first 21 d; 20 mg PO daily for remaining treatment (taken with food at approximately the same time each day)
  - consider thrombolysis if extensive DVT causing limb compromise
  - IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
  - duration of anticoagulation: 3 months if transient coagulopathy; 6 months if unprovoked DVT; life-long if ongoing coagulopathy

**PULMONARY EMBOLISM (PE)**

**Presentation**
- dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

**Investigations**
- use Wells’ criteria for PE to guide investigations (Figures 13-14)
- PERC score alone can rule out PE in low risk patients (as determined by Wells’ criteria) unless patient is pregnant
- ECG and CXR are useful to rule out other causes (e.g. ACS, pneumonia, pericarditis) or to support diagnosis of PE
  - ECG changes in PE: sinus tachycardia, right ventricular strain (S1Q3T3), T wave inversions in anterior and inferior leads
  - CXR findings in PE: Hampton's hump (triangular density extending from pleura) or Westermark's sign
- D-dimer is only useful at ruling out a PE if it is negative in low to moderate risk patients (highly sensitive)
  - if positive D-dimer or high-probability patient, then pursue CT angiography or V/Q scan
  - CT angiography has high sensitivity and specificity for PE, may also suggest other etiology
  - V/Q scan useful in pregnancy, when CT angiography not available, or IV contrast contraindicated

**Management of PE**
- treatment of PE with anticoagulation and duration of treatment is the same as for DVT (see above)
- consider thrombolysis if extensive PE causing hemodynamic compromise or cardiogenic shock
- catheter-directed thrombolysis or surgical thrombectomy rarely considered in massive PE or contraindication to anticoagulation
- often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O2, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
- referral to medicine for coagulopathy and malignancy workup

---

**Figure 12. Approach to suspected DVT**

---
Diabetic Emergencies

- see Endocrinology, E11

Diabetic Ketoacidosis

- triad of hyperglycemia, ketosis, and acidosis due to severe insulin deficiency and counter-regulatory hormone excess
- clinical presentation
  - often young, Type 1 DM patients, (may rarely be first presentation of undiagnosed Type 2 DM) with symptoms evolving within a day
  - early signs and symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - GI: anorexia, nausea, vomiting, abdominal pain
    - neurological: fatigue, drowsiness, stupor, coma
    - respiratory: Kussmaul’s respiration, dyspnea (often due to acidosis), fruity ketotic breath
- investigations
  - blood work: CBC, electrolytes, Ca++, Mg++, PO4-, Cr, BUN, glucose, ketones, osmolality, AST/ALT/ALP, amylase, troponin
  - urine: glucose and ketones
  - ABG
  - ECG (MI is possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
  - rehydration
    - bolus of NS, then high rate NS infusion (be aware of overhydration and cerebral edema, especially in pediatric patients)
  - beware of a pseudohyponatremia due to hyperglycemia (add 3 NaCl to the formula)
  - potassium
    - essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial K+ <5.5 mmol/L)
    - use cardiac monitoring if potassium levels normal or low

Clinical Criteria to Prevent Unnecessary Diagnostic Testing in Emergency Department Patients with Suspected Pulmonary Embolism

Purpose: To develop PE rule-out criteria (PERC) that can be used at the bedside, and prevents overtreatment for PE, which includes the D-dimer test that frequently results in false positives.

Study: 21 variables were collected prospectively from 3,148 ER patients evaluated for possible PE to develop rule-out criteria. The application of the developed rules was investigated in 1,427 low-risk patients and 382 very low-risk patients.

Results: Eight variables were included in a block rule (age > 50 y, pulse < 100 bpm, SaO2 > 94%, no unilateral leg swelling, no hemoptysis, no recent trauma or surgery, no prior PE or DVT, no hormone use) and a negative score was used to rule-out PE.

In low-risk and very-low-risk patients, the rule had a sensitivity of 98 and 100%, respectively and a specificity of 27 and 15%, respectively.

Summary: D-dimer testing for PE may not be favourable if all eight factors in the PERC are negative.

Oral Rivaroxaban for the Treatment of Symptomatic Venous Thromboembolism

NEJM 2012;366:1297-1297

Background: Evidence supporting rivaroxaban as effective therapy in DVT may also apply to simplify treatment of PE.

Methods: A randomized, open-label, event-driven, non-inferiority trial involving 4,832 patients with acute symptomatic PE with or without DVT, was undertaken to compare rivaroxaban (15 mg twice daily for 3 wk, followed by 20 mg once daily) with standard therapy of enoxaparin followed by an adjusted-dose vitamin K antagonist.

Results: Rivaroxaban was non-inferior to standard therapy (non-inferiority margin, 2.0; p = 0.003) for preventing recurrent VTE (HR: 1.12; 95% CI 0.75-1.68). Major bleeding occurred less in the rivaroxaban group (hazard ratio, 0.49; 95% CI 0.31-0.78; p = 0.003). Rates of other adverse events were similar in the two groups.

Conclusions: A fixed-dose regimen of rivaroxaban alone was non-inferior to standard therapy for the initial and long-term treatment of PE.

Oral Rivaroxaban for the Treatment of Symptomatic Pulmonary Embolism

NEJM 2010;363:2499-2510

Background: Rivaroxaban, an oral factor Xa inhibitor, hypothesized to provide a simple, fixed-dose regimen for treating acute DVT and for continued treatment, without the need for laboratory monitoring.

Methods: An open-label, randomized, event-driven, non-inferiority study compared oral rivaroxaban alone (15 mg twice daily for 3 wk, followed by 20 mg once daily) with standard therapy of subcutaneous enoxaparin followed by vitamin K antagonist in patients with acute, symptomatic DVT (sample size: 3,449 patients). In parallel, a double-blind, randomized, event-driven superiority study was conducted to compare rivaroxaban alone (20 mg once daily) versus placebo in patients who had received treatment for VTE (sample size: 602 patients in intervention vs 594 in placebo group).

Results: Rivaroxaban had non-inferior efficacy with respect to recurrent VTE (HR: 0.69; 95% CI 0.44-1.04). Similar bleeding prevalence were reported in each group. In the parallel continued-treatment study, rivaroxaban had superior efficacy with respect to preventing VTE (HR: 0.18; 95% CI 0.09-0.39). Four patients in the rivaroxaban group had fatal major bleeding vs. none in the placebo group (p = 0.11).

Conclusions: Rivaroxaban offers a single-dose approach to treatment of VTE that may improve the benefit-to-risk profile of anticoagulation.
• insulin
  • critical, as this is the only way to turn off gluconeogenesis/ketosis
  • do not give insulin if K+ <3.3 mmol/L
  • initial bolus of 5-10 U short-acting/regular insulin (or 0.2 U/kg) IV in adults (controversial – may just start with infusion)
  • followed by continuous infusion at 5-10 U (or 0.1 U/kg) per hour
  • once the blood glucose <14 mmol/L, patient should receive their regular insulin SC injection and the infusion stopped in 1 hour
  • add D5W to IV fluids when blood glucose <15 mmol/L to prevent hypoglycemia
  • bicarbonate is not given unless patient is at risk of death or shock (typically pH <7.0)

Hyperosmolar Hyperglycemic State
• state of extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, counter-regulatory hormones excess, gluconeogenesis, and dehydration (due to osmotic diuresis)
• clinical presentation
  • often older, Type 2 DM patients with more co-morbid illnesses and larger fluid losses with symptoms evolving over days to weeks, less GI symptoms and more neurological deficits than DKA including: mental disturbances, coma, delirium, seizures
  • polyuria, N/V
• investigations
  • blood work: CBC, electrolytes, Ca++, Mg++, PO4, Cr, BUN, glucose, ketones, osmolality
  • urine: glucose and ketones
  • ABG
  • find underlying cause: ECG, CXR, blood and urine C&S
• management
  • rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  • O2: and cardiac monitoring, frequent electrolyte and glucose monitoring
  • insulin is controversial
  • identify and treat precipitant if present (the 5 Is)

Hypoglycemia
• characterized by Whipple’s triad: low plasma glucose, symptoms suggestive of hypoglycemia, prompt resolution of symptoms with glucose
• clinical presentation
  • autonomic symptoms: headaches, confusion, seizures, coma
  • neuroglycopenic symptoms: diaphoresis, nausea, hunger, tachycardia, palpitations
• history and physical exam
  • last meal, known DM, prior similar episodes, drug therapy, and compliance
  • liver/renal/endocrine/neoplastic disease
  • depression, alcohol or drug use
• management
  • IV access and rapid blood glucose measurement
  • D50W 50 mL IV push, glucose PO if mental status permits
  • if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
  • O2, cardiac, frequent blood glucose monitoring
  • thiamine 100 mg IM
  • full meal as soon as mental status permits
  • if episode due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long t1/2 (may require admission for monitoring)
  • search for cause (most often due to exogenous insulin, alcohol, or sulfonylureas)
Electrolyte Disturbances

- see Nephrology, NP7 and Endocrinology, E36

Hypertensive Emergencies

### Hypertensive Emergency (Hypertensive Crisis)

- Definition: severe elevation of BP with evidence of end-organ damage (CNS, retinal, CVS, renal, GI)
- Etiology
  - Essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy
- Clinical presentation

#### Table 21. Signs and Symptoms of Hypertensive Emergencies

<table>
<thead>
<tr>
<th>CNS</th>
<th>Retinal</th>
<th>Renal</th>
<th>Cardiovascular</th>
<th>Gastrointestinal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stroke/TIA, headache, altered mental status, seizures, hemorrhage</td>
<td>Vision change, hemorrhage, exudates, papilledema</td>
<td>Nocturia, elevated Cr, proteinuria, hematuria, oliguria</td>
<td>Ischemia/angina, infarction, dissection (back pain), CHF</td>
<td>N/V, abdominal pain, increased liver enzymes</td>
</tr>
</tbody>
</table>

- Investigations
  - Blood work: CBC, electrolytes, BUN, Cr
  - Urinalysis
  - Peripheral blood smear: to detect microangiopathic hemolytic anemia
  - CXR: if SOB or chest pain
  - ECG, troponins, CK: if chest pain
  - CT head: if neurological findings or severe headache
  - Toxicology screen if sympathomimetic overdose suspected

- Management
  - In general, the strategy for management is to gradually and progressively reduce BP in 24-48 h
  - Lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol)
  - If preeclampsia, immediately consult OB/GYN (see Obstetrics, OR24)
  - Establish arterial line; transfer to ICU for further reduction in BP under monitored setting
  - In case of ischemic stroke: do not rapidly reduce BP; maintain BP > 150/100 for 5 d
  - In case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - In case of excessive catecholamines: avoid β-blockers (except labetalol)
  - In case of ACS: address ischemia initially, then BP

- Catecholamine-Induced Hypertensive Emergencies
  - Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed
Hypertensive Urgency

- definition: severely elevated BP (usually sBP >180, dBP >110) with no evidence of end-organ damage
- most commonly due to non-adherence with medications
- treatment: initiate/adjust antihypertensive therapy, monitor in ED (up to 6 h) and discharge with follow up for 48-72 h
- goal: differentiate hypertensive emergencies from hypertensive urgencies

Table 22. Commonly Used Agents for the Treatment of Hypertensive Crisis

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dosage</th>
<th>Onset of Action</th>
<th>Duration of Action</th>
<th>Adverse Effects*</th>
<th>Special Indications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sodium Nitroprusside</td>
<td>0.25-10 µg/kg/min</td>
<td>Immediate</td>
<td>3-5 min</td>
<td>N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome</td>
<td>Most hypertensive emergencies, especially CHF, aortic dissection. Use in combination with β-blockers (e.g. esmolol) in aortic dissection. Caution with high ICP and azotemia.</td>
</tr>
<tr>
<td>Labetalol</td>
<td>5-10 mg IV bolus, then 4 mg/kg/h IV</td>
<td>5-10 min</td>
<td>2-6 h</td>
<td>Dizziness, drowsiness, headache, tachycardia, Na+ retention</td>
<td>Eclampsia</td>
</tr>
<tr>
<td>Nicardipine (CCB)</td>
<td>2 mg IV bolus, then 4 mg/kg/h IV</td>
<td>15-30 min</td>
<td>40 min</td>
<td>Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, RF, eclampsia, sympathetic crisis)</td>
<td>Most hypertensive emergencies, Caution with acute CHF</td>
</tr>
<tr>
<td>Fenoldopam Mesylate (dopamine receptor antagonist)</td>
<td>0.05-0.1 µm/kg/min IV</td>
<td>&lt;5 min</td>
<td>8-10 min</td>
<td>Tachycardia, headache, nausea, flushing (e.g. acute RF)</td>
<td>Most hypertensive emergencies, Caution with glaucoma</td>
</tr>
<tr>
<td>Enalapril (ACEI)</td>
<td>0.625-1.25 mg q6h</td>
<td>15-30 min</td>
<td>12-24 h</td>
<td>Theoretical fall in pressure in high renin states not seen in studies</td>
<td>Acute LV failure, Avoid in acute MI, pregnancy, acute RF</td>
</tr>
<tr>
<td>Nitroglycerin</td>
<td>5-20 µg/min IV</td>
<td>1-2 min</td>
<td>3-5 min</td>
<td>Hypotension, bradycardia, headache, lightheadedness, dizziness</td>
<td>MI/pulmonary edema</td>
</tr>
<tr>
<td>Hydralazine</td>
<td>5-10 mg IV/IM q20min (max 20 mg)</td>
<td>5-20 min</td>
<td>2-6 h</td>
<td>Dizziness, drowsiness, headache, tachycardia, Na+ retention</td>
<td>Eclampsia</td>

<tbody>
<tr>
<td>Labetalol</td>
<td>20 mg IV bolus q10min or 0.5-2 mg/min</td>
<td>5-10 min</td>
<td>3-6 h</td>
<td>Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension</td>
<td>Most hypertensive emergencies (especially eclampsia), Avoid in acute CHF, heart block &gt;1st degree</td>
</tr>
<tr>
<td>Esmolol</td>
<td>250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat</td>
<td>1-2 min</td>
<td>10-20 min</td>
<td>Hypotension, nausea, bronchospasm</td>
<td>Aortic dissection, acute MI, SVT dysrhythmias, perioperative HTN, Avoid in acute CHF, heart block &gt;1st degree</td>
</tr>
<tr>
<td>Phentolamine</td>
<td>5-15 mg q5-15min</td>
<td>1-2 min</td>
<td>3-10 min</td>
<td>Tachycardia, headache, flushing</td>
<td>Catecholamine excess (e.g. pheochromocytoma)</td>
</tr>
</tbody>
</table>

*Hypotension may occur with all of these agents

Acute Coronary Syndrome

- see Cardiology and Cardiac Surgery, C27
- definition: new onset of chest pain, or acute worsening of previous chest pain, or chest pain at rest with:
  - negative cardiac biomarkers and no ECG changes = Unstable angina (UA)
  - positive cardiac biomarkers (elevated troponin) and no ECG changes = NSTEMI
  - positive cardiac biomarkers (elevated troponin) and ST segment elevation on ECG = STEMI
- investigations
  - ECG STAT (as soon as ACS is suspected on history), troponin (2-6 hours after symptom onset), CXR (to rule out other causes)
- management
  - stabilize: ABCs, oxygen, IV access, cardiac monitors, oximetry
  - ASA 162-325 mg chewed and swallowed
  - nitroglycerin 0.3 mg SL q5min x 3; IV only if persistent pain, CHF, or hypertensive
- contraindications: hypotension, phosphodiesterase inhibitor use, right ventricular infarctions (½ of all inferior MIs)
anticoagulation: choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or prasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy

early cardiology consult for reperfusion therapy
  • UA/NSTEMI: early coronary angiography recommended if high TIMI risk score
  • STEMI: primary percutaneous coronary intervention (within 90 min) preferred; thrombolytics if unavailable within 120 min of medical contact, symptoms <12 hr and no contraindications
• atorvastatin 80 mg to stabilize plaques
• β-blocker if no signs of CHF, hemodynamic compromise, bradycardia or severe reactive airway disease
• ACEI initiated within 24 hours

Sepsis

• see Infectious Diseases, ID21 and Respiratory, R33
• definitions
  • SIRS: Two or more of: 1) T < 36 or > 38; 2) Pulse > 90 bpm; 3) RR > 20 breaths per min (or PaCO₂ < 30 mmHg); 4) WBC > 12 x 10³ cells/L, or < 4 x 10³ cells/L, or > 10% bands
• sepsis: SIRS in response to infection
  • severe sepsis: sepsis and signs of organ dysfunction (altered mental status, lung injury, renal failure, coagulopathy, decreased urine output, lactic acidosis, liver failure)
  • septic shock: severe sepsis and hypotension (sBP <90) unresponsive to IV crystalloid
• management
  • early recognition of sepsis and investigations to locate source of infection
  • identify severe sepsis with lactate or evidence of tissue hypoperfusion
  • treatment priorities
    • ABCs, monitors, lines
    • aggressive fluid resuscitation; consider ventilatory and inotropic support
    • cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
    • source control - e.g. remove infected Foley or surgery for ischemic gut
  • monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial lactates

Stroke and TIA

• see Neurology, N48
• definitions
  • stroke: sudden loss of brain function due to ischemia (80%) or hemorrhage (20%) with persistence of symptoms >24 hr or neuroimaging evidence
  • TIA: transient episode of neurologic dysfunction from focal ischemia without acute infarction typically lasting <1 h, but defined as <24 h
• clinical presentation

Table 23. Signs and Symptoms of Stroke

</table>
Otolaryngological Presentations and Emergencies

Investigations
• CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
• non-contrast CT head: look for hemorrhage, ischemia
• ECG ± echocardiogram: rule out AFib, acute MI as source of emboli
• other imaging: carotid Dopplers, CTA, MRA as appropriate

Management
• ABCs; intubation with RSI if GCS ≤ 8, rapidly decreasing GCS, or inadequate airway protection reflexes
• thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
• elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
• NPO, IV ± cardiac monitoring
  ▪ judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
• BP control: only treat severe HTN (sBP > 200, dBP > 120, mean arterial BP > 140) or HTN associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
• glycemic control: keep fasting glucose < 6.5 in acute phase (5 d)
• cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
• consult neurosurgery, neurology, medicine as indicated

Medications
• acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
• antiplatelet agents: prevent recurrent stroke or stroke after TIs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
• anticoagulation: DVT prophylaxis if immobile; treat AFib if present
• follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization

Otolaryngological Presentations and Emergencies

• see Otolaryngology, OT6
• ear associated symptoms: otalgia, aural fullness, otorrhea, hearing loss, tinnitus, vertigo, pruritis, fever
• risk factors: Q-tip use, hearing aids, headphones, occupational noise exposure

Dizziness and Vertigo
• distinguish four types of dizziness: vertigo (“room spinning”), lightheadedness (“disconnected from environment”), presyncope (“almost blacking out”), dysequilibrium (“unstable, off-balance”)
• broad differential and diverse management (see Family Medicine, FM25; Otolaryngology, OT6)
• consider medication adverse effects

Otalgia (see Otolaryngology, OT6)
• differential diagnosis
  ▪ infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  ▪ others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
• observe for otorrhea, palpation of outer ear/mastoid, otoscope to see bulging erythematous tympanic membrane, perforation
• C&S of ear canal discharge, if present
• CT head if suspicion of mastoiditis, malignant otitis externa
• antibiotics/antifungals/antivirals for respective infections

Hearing Loss (see Otolaryngology, OT7)
• differentiate conductive versus sensorineural hearing loss
• rule out sudden sensorineural hearing loss (SNHL), a medical emergency requiring high dose steroids and urgent referral
• in elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise
• consider audiogram and referral or follow-up with family physician

Epistaxis

• see Otolaryngology, OT26
• 90% of nosebleeds stem from the anterior nasal septum (at Kiesselbach’s plexus located in Little’s area)
• can be life-threatening
Etiology
- most commonly caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin®), or systemic disease (coagulopathies, HTN, etc.)

Investigations
- blood work: CBC, PT/PTT (as indicated)
- imaging: X-ray, CT as needed

Treatment
- aim is to localize bleeding and achieve hemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthesia/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or toxic shock syndrome
  - if bleeding is controlled with anterior pressure, cautery with silver nitrate can be performed if the site of bleeding is identified (one side of septum only because if both are cauterized this can lead to septal perforation)
- if suspect posterior bleed or anterior packing does not provide hemostasis, consult ENT for posterior packing and further evaluation
- posterior packing requires monitoring because can cause significant vagal response and posterior bleeding source can lead to significant blood loss, therefore usually requires admission

Disposition
- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, topical ointments, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding, and most cases of posterior packing

Gynecologic/Urologic Emergencies

Vaginal Bleeding

- see Gynecology, GY10 and Obstetrics, OB13

Etiology
- pregnant patient
  - 1st/2nd trimester pregnancy: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  - 2nd/3rd trimester pregnancy: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp, passing of mucous plug
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
  - dysfunctional uterine bleeding, uterine fibroids, pelvic tumours, trauma, endometriosis, PID, exogenous hormones

History
- characterize bleeding (frequency, duration, number of pads/tampons, cyclicity)
- pain, if present (OPQRSTU)
- menstrual history, sexual history, STI history, syncope/pre-syncope
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

Physical Exam
- ABC (especially noting postural BP/HR and mucous membrane)
- abdominal examination (peritoneal signs, tenderness, distension, mass)
- speculum examination (NOT IF 2nd/3rd trimester bleeding; perform only when placenta previa is ruled out with U/S)
  - look for active bleeding, trauma/anomaly, and cervical dilatation
  - use sterile speculum if pregnant
- bimanual examination (cervical tenderness, size of uterus, cervical length/dilatation)
- sterile gloves if pregnant

Complications of Nasal Packing
- Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack
- Complications of Nasal Packing
  - Hypoxemia
  - Toxic-shock syndrome
  - Aspiration
  - Pharyngeal fibrosis/stenosis
  - Alar/septal necrosis

Gynaecology can be life-threatening
Always start with ABCs and ensure your patient is stable
Investigations
- β-hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative β-hCG, PT, INR
- type and cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa and fetal demise)
- postpartum
  - U/S for retained products
  - β-hCG if concerned about retained tissue

Management
- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic; discharge patient with obstetrics follow-up
  - U/S indeterminate or β-hCG >1,000-2,000 IU: further workup and/or gynecology consult
- abortions: if complete, discharge if stable; for all others, acquire gynecology consult
- 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type and cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - dysfunctional uterine bleeding (prolonged or heavy flow ± breakthrough bleeding and without ovulation, a diagnosis of exclusion)
    - <35-40 yr of age: Provera® 10 mg PO OD x 10 d, warn patient of a withdrawal bleed, discharge if stable
    - if unstable, admit for IV hormonal therapy, possible D&C
  - >35-40 yr of age: uterine sampling necessary prior to initiation of hormonal treatment to rule out endometrial cancer, U/S for any masses felt on exam
  - tranexamic acid (Cyklokapron®) to stabilize clots
  - structural abnormalities: fibroids or uterine tumours may require excision for diagnosis/treatment, U/S for workup of other pelvic masses, Pap smear/biopsy for cervical lesions

Disposition
- decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult gynecology for admitted patients
- if patient can be safely discharged, ensure follow-up with family physician or gynecologist
- instruct patient to return to ED for increased bleeding, presyncope

Nephrolithiasis (Renal Colic)

- see Urology, U17

Epidemiology and Risk Factors
- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

Clinical Features
- urinary obstruction → upstream distention of ureter or collecting system → severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, never comfortable, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

Differential Diagnosis of Renal Colic
- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- urogynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, testicular torsion
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

Investigations
- screening
- CBC: elevated WBC in presence of fever suggests infection
- electrolytes, Cr, BUN to assess renal function
- UA: R&M (WBCs, RBCs, crystals), C&S
- imaging
- non-contrast spiral CT is the study of choice
- abdominal U/S may demonstrate stone or hydronephrosis (consider in females of childbearing age)
- AXR will identify large radioopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radioopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine stone analysis

Management
- analgesics: NSAIDs (usually ketorolac [Toradol™], preferable over opioids), antiemetics, IV fluids
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) may be helpful to increase stone passage in select cases

Disposition
- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and is able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

Ophthalmologic Emergencies

- see Ophthalmology, OP5

History and Physical Exam
- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion → if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital X-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- visual acuity in both eyes, pupils, extraocular structures, fundoscopy, tonometry, slit lamp exam

Management of Ophthalmologic Foreign Body
- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

Visual acuity is the “vital sign” of the eyes and should ALWAYS be assessed and documented in both eyes when a patient presents to the ER with an ophthalmologic complaint.

</table>

**Contraindications to Pupil Dilation**
- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Cautions with CV disease — mydriatics can cause tachycardia

**Other Ophthalmologic Emergencies**
- **Infectious:** Red eye, endophthalmitis, hypopyon
- **Trauma:** Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphaema, lens dislocation, retrobulbar hemorrhage
- **Painful vision loss:** Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrobulbar hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis
- **Painless vision loss:** Central retinal vein occlusion, amaurosis fugax, occipital stroke

**Dermatologic Emergencies**

**Rash Characteristics**

**A. Diffuse Rashes**

- **Staphylococcal Scalded Skin Syndrome (SSSS)**
  - caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
  - mostly occurs in children
  - prodrome: fever, irritability, malaise, and skin tenderness
  - sudden onset of diffuse erythema: skin is red, warm, and very tender
  - flaccid bullae that are difficult to see, then desquamate in large sheets
  - Nikolsky’s sign: gentle lateral stroking of skin causes epidermis to separate

- **Toxic Epidermal Necrolysis (TEN): >30% of BSA**
  - see Dermatology, D22
  - caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - usually occurs in adults
  - diffuse erythema followed by necrosis
  - severe mucous membrane blistering
  - entire epidermis desquamation
  - high mortality (>50%)

- **Toxic Shock Syndrome (TSS)**
  - see Infectious Diseases, ID23
  - caused by superantigen from *S. aureus* or GAS activating T-cell and cytokines
  - patient often presents with onset of shock and multi-organ failure, fever
  - diffuse erythematous macular rash
  - at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)
Dermatologic Emergencies

- vesicobullous lesions
- Erythema Multiforme (EM)
  - see Dermatology, D29
  - immunologic reaction to herpes simplex
  - viral prodrome 1-14 d before rash
  - "target lesion": central grey bulla or wheal surrounded by concentric rings of erythema and normal skin
- Stevens-Johnson Syndrome (SJS): <10% of BSA
  - see Dermatology, D22
  - related to drugs such as antiepileptics and biologic agents (e.g. infliximab)
  - EM with constitutional symptoms and mucous membrane involvement (milder mucous membrane involvement than TEN)

B. Discrete Lesions
- pyoderma gangrenosum
  - often associated with immunocompromised patients (HIV, leukemia, or lymphoma) with Gram-negative sepsis
  - often occurs in arms, hands, feet, or perineal region
  - usually begins as painless macule/vesicle pustule/bulla on red/blue base sloughing, leaving a gangrenous ulcer
- disseminated gonococcal infection
  - see Dermatology, D32
  - fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - most commonly in gonococcus positive women during menstruation or pregnancy
  - skin lesions usually appear in extremities and resolve quickly (<7 d)
- meningococcemia
  - flu-like symptoms of headache, myalgia, N/V
  - petechial, macular, or maculopapular lesions with grey vesicular centres
  - usually a few millimeters in size, but may become confluent and hemorrhagic
  - usually appear in extremities, but may appear anywhere
  - look for signs of meningeal irritation: Brudzinski, Kernig, nuchal rigidity, jolt accentuation

**History and Physical Exam**
- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medication history
- vitals

**Investigations**
- immediate consultation if patient unstable
- CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

**Management**
- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococcemia
  - IV antibiotics
  - EM, SJS, and TEN
    - stop precipitating medication
    - fluids
    - symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IVIG
    - TEN: debride necrotic tissue

**Disposition**
- most cases will require urgent care and hospitalization
- TEN: early transfer to burn centre improves outcome
Environmental Injuries

Heat Exhaustion and Heat Stroke

- Predisposing factors: young persons who overexert themselves, older adults who cannot dissipate heat at rest (e.g. using anticholinergic drugs such as antihistamines or TCAs), and patients with schizophrenia who are using anticholinergic or antiepileptic medications

Heat Exhaustion
- Clinical features relate to loss of circulating volume caused by exposure to heat stress
- "Water depletion": heat exhaustion occurs if lost fluid not adequately replaced
- "Salt depletion": heat exhaustion occurs when losses replaced with hypotonic fluid

Heat Stroke
- Life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- Divided into classical and exertional subtypes
- If patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, other infections)

Table 28. Heat Exhaustion vs. Heat Stroke

<table>
<thead>
<tr>
<th>Clinical Features</th>
<th>Heat Exhaustion</th>
<th>Classical Heat Stroke</th>
<th>Exertional Heat Stroke</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body temp &lt; 32°C</td>
<td>Non-specific malaise, headache, fatigue</td>
<td>Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation)</td>
<td>Occurs with high endogenous heat production (e.g. exercise) that overwhelms homeostatic mechanisms</td>
</tr>
<tr>
<td>No coma or seizures</td>
<td>Dehydration (HR, orthostatic hypotension)</td>
<td>Often patients are older, poor, and sedentary or immobile</td>
<td>Patients often younger, more active</td>
</tr>
<tr>
<td>Temp usually &gt; 40.5°C</td>
<td>Altered mental status, seizures, delirium, or coma</td>
<td>May have elevated AST, ALT</td>
<td>Skin often diaphoretic</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Treatment</th>
<th>Rest in a cool environment IV NS if orthostatic hypotension; otherwise replace losses slowly PO</th>
<th>Cool body temperature with water mist (e.g. spray bottle) and standing fans</th>
<th>Ice water immersion also effective; monitor body temperature closely to avoid hypothermic overshoot</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Secure airway because of seizure and aspiration risk</td>
<td>Give fluid resuscitation if still hypotensive after above therapy</td>
<td>Avoid β-agonists (e.g. epinephrine), peripheral vasconstriction, and antipyretics (e.g. ASA)</td>
</tr>
</tbody>
</table>

Hypothermia and Cold Injuries

HYPOTHERMIA
- Predisposing factors: extremes of age, lack of housing, drug overdose, EtOH ingestion, trauma (incapacitating), cold water immersion, outdoor sports
- Treatment based on re-warming and supporting cardiorespiratory function
- Complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume and electrolyte depletion
- Labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN, Mg++, Ca++, amylase, coagulation profile
- Imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- Monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

Table 29. Classification of Hypothermia

<table>
<thead>
<tr>
<th>Class</th>
<th>Temp</th>
<th>Symptoms/Signs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mild</td>
<td>32-34.9°C</td>
<td>Tachypnea, tachycardia, ataxia, dysarthria, shivering</td>
</tr>
<tr>
<td>Moderate</td>
<td>28-31.9°C</td>
<td>Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behaviour, muscle rigidity, dilated pupils</td>
</tr>
<tr>
<td>Severe</td>
<td>&lt; 28°C</td>
<td>Coma, hypotension, acidemia, VFib, asystole, flaccidity, apnea</td>
</tr>
</tbody>
</table>

Re-warming Options
- Gentle fluid and electrolyte replacement in all (due to cold diuresis)
- Passive external re-warming
  - Suitable for most stable patients with core temperature >32.2°C
  - Involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
Environmental Injuries

• active external re-warming
  ■ involves use of warming blankets
  ■ beware of "afterdrop" phenomenon
  ■ safer when done in conjunction with active core re-warming

• active core re-warming
  ■ generally for patients with core temperature <32.2°C, and/or with cardiovascular instability
  ■ avoids "afterdrop" seen with AER alone
  ■ re-warm core by using
    ◆ warmed humidified oxygen, IV fluids
    ◆ peritoneal dialysis with warm fluids
    ◆ stric/colonic/pleural irrigation with warm fluids
    ◆ external circulation (cardiopulmonary bypass machine) is most effective and fastest

Approach to Cardiac Arrest in the Hypothermic Patient
• do all procedures gently or may precipitate VFib
• check pulse and rhythm for at least 1 min; may have profound bradycardia
• if any pulse at all (even very slow) do NOT do CPR
• if in VFib try to defibrillate up to maximum 3 shocks if core temperature <30°C
• intubate if required, ventilate with warmed, humidified O₂
• medications (vasopressors, antidysrhythmics) may not be effective at low temperatures
  ◆ controversial; may try one dose
• focus of treatment is re-warming

FROSTBITE

Classification
• ice crystals form between cells
• classified according to depth – similar to burns (1st to 3rd degree)
• 1st degree
  ■ symptoms: initial paresthesia, pruritus
  ■ signs: erythema, edema, hyperemia, no blisters
• 2nd degree
  ■ symptoms: numbness
  ■ signs: blistering (clear), erythema, edema
• 3rd degree
  ■ symptoms: pain, burning, throbbing (on thawing); may be painless if severe
  ■ signs: hemorrhagic blisters, skin necrosis, edema, no movement

Management
• treat for hypothermia: O₂, IV fluids, maintenance of body warmth
• remove wet and constrictive clothing
• immerse in 40-42°C agitated water for 10-30 min (very painful; administer adequate analgesia)
• clean injured area and leave it open to air
• consider aspiration/debridement of blisters (controversial)
• debride skin
• tetanus prophylaxis
• consider penicillin G as frost bite injury has high risk of infection
• surgical intervention may be required to release restrictive eschars
• never allow a thawed area to re-chill/freeze

Burns

• see Plastic Surgery, PL17

Clinical Presentation/Physical Exam Findings
• burn size
  ■ rule of nines; does not include 1st degree burns
• burn depth
  ■ superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  ■ superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  ■ deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation
  ■ full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensitive, and charred or leathery
  ■ deep (4th degree): involvement of fat, muscle, even bone

Management
• remove noxious agent/stop burning process
• establish airway if needed (indicated with burns >40% BSA or smoke inhalation injury)
• resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)
• Fluid boluses if unstable
  ■ Parkland Formula: Ringer's lactate 4 cc/kg/%BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  ■ Urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics
  • Pain relief: continuous morphine infusion with breakthrough bolus
  • Investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
  • Burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
  • Escharotomy or fasciotomy for circumferential burns (chest, extremities)
  • Topical antibiotics, systemic antibiotics infrequently indicated
  • Tetanus prophylaxis if burn is deeper than superficial dermis

Disposition
• Admit
  ■ 2nd degree burns >10% BSA, or any significant 3rd degree burns
  ■ 2nd degree burns on face, hands, feet, perineum, or across major joints
  ■ Electrical, chemical burns, and inhalation injury
  ■ Burn victims with underlying medical problems or immunosuppressed patients

Inhalation Injury

Etiology
• CO or cyanide poisoning
• Direct thermal injury: limited to upper airway
• Smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

History and Physical Exam
• Risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
• Cherry red skin (unreliable, usually post-mortem finding)
• Singed nasal hairs, soot on oral/nasal membranes, sooty sputum
• Hoarseness, stridor, dyspnea
• Decreased LOC, confusion
• PO2 normal but O2 saturation low suggests CO poisoning

Investigations
• Measure carboxyhemoglobin levels, co-oximetry
• ABG
• CXR ± Bronchoscopy

Management
• CO poisoning: 100% O2 ± hyperbaric O2 (controversial)
• Direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators, and mucolytics (N-acetylcysteine)

Bites

Mammalian Bites
• See Plastic Surgery, PI.10

History
• Time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, rabies risks, HIV/hepatitis risk (human bite)
• High morbidity associated with clenched fist injuries, "fight bites"

Physical Exam
• Assess type of wound: abrasion, laceration, puncture, crush injury
• Assess for direct tissue damage: skin, bone, tendon, neurovascular status

Investigations
• If bony injury or infection suspected, check for fracture and gas in tissue with x-rays
• Get skull films in children with scalp bite wounds ± CT to rule out cranial perforation
• Ultrasound may be helpful for identifying abscess formation as well as locating radiolucent foreign bodies in infected wounds

Initial Management
• Wound cleansing and copious irrigation as soon as possible
• Irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
• Debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
• culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound
• suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention
• tetanus immunization if >10 yr or incomplete primary series

Prophylactic Antibiotics
• types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
• a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present (efficacy not proven)
• dog and cat bites (pathogens: Pasteurella multocida, S. aureus, S. viridans)
  - 10-50% of cat bites, 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid
• human bites (pathogens: Eikenella corrodens, S. aureus, S. viridans, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
• rabies (see Infectious Diseases, ID20)
  - reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence

INSECT BITES
• bee stings
  - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  - history and physical exam key to diagnosis; no lab test will confirm
• investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
• ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids, β-agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
• West Nile virus (see Infectious Diseases, ID24)

Near Drowning
• most common in children <4 yr and teenagers
• causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
• must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
• complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

Physical Exam
• ABCs, vitals: watch closely for hypotension
• respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
• CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
• H&N: assess for C-spine injuries
• neurological: GCS or AVPU, pupils, focal deficits

Investigations
• labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
• imaging: CXR (pulmonary edema, pneumothorax) ± C-spine imaging
• ECG

Management
• ABCs, treat for trauma, shock, hypothermia
• cardiac and O2: monitors, IV access
• intensive respiratory care
  - ventilator assistance if decreased respirations, pCO2 >50 mmHg, or pO2 <60 mmHg on maximum O2
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow O2/CPAP/BiPAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
  - dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
  - vomiting: very common, NG suction to avoid aspiration
  - convulsions: usually respond to O2; if not, diazepam 5-10 mg IV slowly
  - bronchospasm: bronchodilators
  - bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (Pseudomonas)
• always initiate CPR in drowning-induced cardiac arrest even if patient hypothermic; continue CPR until patient is fully rewarmed
Disposition
- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (24 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

Toxicology

“ABCD3EFG” of Toxicology

- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable

A  Airway (consider stabilizing the C-spine)
B  Breathing
C  Circulation
D1  Drugs
    ▪ ACLS as necessary to resuscitate the patient
    ▪ universal antidotes
D2  Draw bloods
D3  Decontamination (decrease absorption)
E  Expose (look for specific toxidromes)/Examine the patient
F  Full vitals, ECG monitor, Foley, X-rays
G  Give specific antidotes and treatments

- reassess
- call Poison Information Centre
- obtain corroborative history from family, bystanders

D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

Dextrose (glucose)
- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5–1.0 g/kg (1–2 mL/kg) IV of D50W
- children: 0.25 g/kg (2–4 mL/kg) IV of D25W

Oxygen
- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO₂ retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

Naloxone (central μ-receptor competitive antagonist, shorter t1/2 than naltrexone)
- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  ▪ adults
    ▪ response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
    ▪ draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2–2.5x IV dose)
      – 1st dose 0.4 mg
      – if no response, deliver second dose 0.6 mg
      – if still no response, deliver remaining 1 mg
  ▪ child
    ▪ 0.01 mg/kg initial bolus IV/IO/ETT
    ▪ 0.1 mg/kg if no response and opioid still suspected to max of 10 mg
- maintenance dose
  ▪ may be required because half-life of naloxone (30–80 min) is much shorter than many opioids
  ▪ hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

Thiamine (Vitamin B1)
- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke’s encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke’s encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

Populations at Risk for Thiamine Deficiency
- Alcoholics
- Anorexics
- Hyperemesis of pregnancy
- Malnutrition states
D2 – Draw Bloods

- essential tests
  - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
  - ABGs, measure O₂ sat
  - ASA, acetaminophen, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen
  - Ca²⁺, Mg²⁺, PO₄³⁻
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical presentation

Serum Drug Levels
- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only)

</tr>
</tbody>
</table>

- Decreased AG
  - Electrolyte imbalance (increased Na⁺/K⁺/Mg²⁺)
  - Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L decrease in the AG)
  - Lithium, bromine elevation
  - Paraproteins (multiple myeloma)

- Normal AG
  - High K⁺: pyelonephritis, obstructive nephropathy, renal tubular acidosis IV, TPN
  - Low K⁺: small bowel losses, acetazolamide, renal tubular acidosis I, II

| Table 31. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning |
|-------------------------------|-------------------------------|
| Test                          | Finding                      | Selected Causes                           |
| ABG                           | Hypoventilation (pCO₂)       | CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) |
|                               | Hyperventilation (pCO₂)      | Salicylates, CO, other asphyxiants         |
| Electrolytes                  | AG metabolic acidosis        | ”MUDPILES CAT“: see Table 30               |
|                               | Hyperkalemia                 | Digitalis glycosides, fluoride, potassium |
|                               | Hypokalemia                  | Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin |
| Glucose                       | Hypoglycemia                 | Oral hypoglycemic agents, insulin, EtOH, ASA |
| Osmolality and Osmolar Gap    | Elevated osmolar gap         | ”MAE DIE“: see Table 30                    |
| ECG                           | Wide QRS complex             | TCAs, quinidine, other class la and lc antidysrhythmic agents |
|                               | Prolonged QT interval        | Terfenadine, astemizole, antipsychotics    |
|                               | Atroventricular block        | Ca²⁺ antagonists, digitalis glycosides, phenylpropanolamine |
| Abdominal X-Ray               | Radioopaque pills or objects | ”CHIPS“: Calcium, Chloral hydrate, CO₂, Heavy metals, Iron, Potassium, Enteric coated Salicylates, and some foreign bodies |
| Serum Acetaminophen           | Elevated level (>140 mg/L or 1,000 μmol/L 4 h after ingestion) | May be only sign of acetaminophen poisoning |
D3 – Decontamination and Enhanced Elimination

Ocular Decontamination
• saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

Dermal Decontamination (Wear Protective Gear)
• remove clothing, brush off toxic agents, irrigate all external surfaces

Gastrointestinal Decontamination
• single dose activated charcoal
  ▪ adsorption of drug/toxin to activated charcoal prevents availability
  ▪ contraindications: caustics, small bowel obstruction, perforation
  ▪ dose: 10 g/g drug ingested or 1g/kg body weight
  ▪ odourless, tasteless, prepared as slurry with H_2O
• whole bowel irrigation
  ▪ 500 mL/h (child) to 2,000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
  ▪ start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
• indications
  ▪ awake, alert, can be nursed upright OR intubated and airway protected
  ▪ delayed release product
  ▪ drug/toxin not bound to charcoal
  ▪ drug packages (if any evidence of breakage emergency surgery)
  ▪ recent toxin ingestion
• contraindications
  ▪ evidence of ileus, perforation, or obstruction
• surgical removal in extreme cases
  ▪ indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
  ▪ no evidence for the routine use of cathartics (i.e. ipecac)

Urine Alkalinization
• may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
• weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

Multidose Activated Charcoal
• may be used for: carbamazepine, phenobarbital, quinine, theophylline
• for toxins which undergo enterohepatic recirculation
• removes drug that has already been absorbed by drawing it back into GI tract
• various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic

Hemodialysis
• indications/criteria for hemodialysis
  ▪ toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  ▪ removal of toxin will lead to clinical improvement
  ▪ advantage is shown over other modes of therapy
  ▪ predicted that drug or metabolite will have toxic effects
  ▪ impairment of normal routes of elimination (cardiac, renal, or hepatic)
  ▪ clinical deterioration despite maximal medical support
• useful for the following toxins
  ▪ methanol
  ▪ ethylene glycol
  ▪ salicylates
  ▪ lithium
  ▪ phenobarbital
  ▪ chloral hydrate (trichloroethanol)
• others include theophylline, carbamazepine, valproate, methotrexate

E – Expose and Examine the Patient
• vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
• head-to-toe survey including
  ▪ C-spine
  ▪ signs of trauma, seizures (incontinence, "tongue biting", etc.), infection (meningismus), or chronic alcohol/drug abuse (track marks, nasal septum erosion)
• mental status

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

## F – Full Vitals, ECG Monitor, Foley, X-Rays

## G – Give Specific Antidotes and Treatments

### Urine Alkalization Treatment for ASA Overdose

- **urine pH > 7.5**
- fluid resuscitate first, then 3 amps NaHCO₃/L of D5W at 1.5x maintenance
- add 20–40 mEq/L KCl if patient is able to urinate

### Table 33. Protocol for Warfarin Overdose

<table>
<thead>
<tr>
<th>INR</th>
<th>Management: Consider Prothrombin Complex Concentrate (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h</th>

* Call local Poison Information Centre for specific doses and treatment recommendations.
Alcohol Related Emergencies

- see Psychiatry, PS23

Acute Intoxication
- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants/street drugs, toxic alcohols
    - may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
    - precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernick's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

Withdrawal
- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1h until calm
    - frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 100 mg IM/IV then 50-100 mg/d
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with DT or multiple seizures

Table 35. Alcohol Withdrawal Signs

<table>
<thead>
<tr>
<th>Time Since Last Drink</th>

</tr>
<tr>
<td></td>
<td></td>
<td>Tachycardia, hyperpyrexia, diaphoresis</td>
</tr>
<tr>
<td></td>
<td></td>
<td>High mortality rate</td>
</tr>
</tbody>
</table>

Cardiovascular Complications
- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias (“holiday heart”)
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

Metabolic Abnormalities
- alcoholic ketoacidosis
  - AG metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
  - generally resolves in 12-24 h
- other alcohols
  - ethylene glycol CNS, CVS, renal findings
  - methanol
    - early: lethargy, confusion
    - late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
- EtOH co-ingestion is protective
treatment
- urgent hemodialysis required
- fomepizole 15 mg/kg IV bolus OR EtOH 10% IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
- consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

Gastrointestinal Abnormalities
- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
- fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: E. coli, Klebsiella, Streptococcus)
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy

Disposition
- before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

Approach to the Overdose Patient

History
- age, weight, underlying medical problems, medications
- substance and how much
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

Physical Exam
- focus on: ABCs, LOC/GCS, vitals, pupils

Disposition from the Emergency Department
- methanol, ethylene glycol
  - delayed onset, admit and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored (ICU) bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 levels going down before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h

Psychiatric Consultation
- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed
Psychiatric Emergencies

Approach to Common Psychiatric Presentations

- see Psychiatry, PS4
- before seeing patient, ensure your own safety; have security/police available if necessary

**History**
- safety
  - assess suicidality: suicidal ideation (SI), intent, plan, lethal means, and past attempts
  - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  - driving and children
  - command hallucinations
  - identify current stressors and coping strategies
  - mood symptoms: manic, depressive
  - anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
  - psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
  - substance use history: most recent use, amount, previous withdrawal reactions
  - past psychiatric history, medications, adherence with medications
  - medical history: obtain collateral if available

**Physical Exam**
- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
- mental status exam: general appearance, behaviour, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

**Investigations**
- investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, and osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated

**Acute Psychosis**

**Differential Diagnosis**
- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)

**Management**
- violence prevention
  - remain calm, empathic, and reassuring
  - ensure safety of staff and patients, have extra staff and/or security on hand
  - patients demonstrating escalating agitation or overt violent behaviour may require physical restraint and/or chemical tranquilization
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  - benzodiazepines: lorazepam 2 mg PO/IM/SL
  - antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult
**Suicidal Patient**

**Epidemiology**
- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr

**Management**
- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts
- admit if there is evidence of intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

### Common Pediatric ED Presentations

#### Modified Glasgow Coma Score

**Table 36. Modified GCS**

<table>
<thead>
<tr>
<th>Eye Opening</th>
<th>Verbal Response</th>
<th>Motor Response</th>

<td>2 – moans to pain</td>
<td>3 – decorticate flexion</td>
</tr>
</tbody>
</table>

**Modified GCS for Infants**

- **Eye Opening**
  - 4 – spontaneously
  - 3 – to speech
  - 2 – to pain
  - 1 – no response
- **Verbal Response**
  - 5 – coos, babbles
  - 4 – irritable cry
  - 3 – cries to pain
  - 2 – moans to pain
  - 1 – no response
- **Motor Response**
  - 6 – normal, spontaneous movement
  - 5 – withdraws to touch
  - 4 – withdraws to pain
  - 3 – decorticate flexion
  - 2 – decerebrate extension
  - 1 – no response

**Modified GCS for Children <4 years**

- **Eye Opening**
  - 4 – spontaneously
  - 3 – to speech
  - 2 – to pain
  - 1 – no response
- **Verbal Response**
  - 5 – oriented, social, speaks, interacts
  - 4 – confused speech, disoriented, consolable
  - 3 – inappropriate words, not consolable/aware
  - 2 – incomprehensible, agitated, restless, not aware
  - 1 – no response
- **Motor Response**
  - 6 – normal, spontaneous movement
  - 5 – localizes to pain
  - 4 – withdraws to pain
  - 3 – decorticate flexion
  - 2 – decerebrate extension
  - 1 – no response

#### Respiratory Distress

- see Pediatrics, P84

**History and Physical Exam**
- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see Pediatrics, P3 for age specific vital signs
- pulsus paradoxus
- wheezing, grunting, vomiting

</tr>
</tbody>
</table>

¹Now rare with Hib vaccine in common use
Management
• croup (usually laryngotracheitis caused by parainfluenza viruses)
  - humidified O₂ should not be given (no evidence for efficacy)
  - racemic epinephrine q1h x 3 doses, observe for ‘rebound effects’
  - nebulized 1:1000 epinephrine (racemic has limited availability)
  - dexamethasone x 1 dose
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
• bacterial tracheitis
  - start croup therapy, but may have poor response
  - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
• epiglottitis
  - 4 D’s: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia, ENT call – intubate
  - then IV fluids, antibiotics, blood cultures
• asthma
  - supplemental O₂ if saturation <90% or PaO₂ <60%
  - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg by masks q20min x 3
  - add 250-500 µg ipratropium (Atrovent®) to first 3 doses salbutamol
  - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.3 mg/kg)
  - if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO₄
  - IV β₂-agonists if critically ill and not responding to above

Febrile Infant and Febrile Seizures

FEBRILE INFANT
• see Pediatrics, P51
• for fever >38°C without obvious focus
  - <28 d
    - admit
    - full septic workup (CBC and differential, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
    - treat empirically with broad spectrum IV antibiotics
  - 28-90 d
    - as above unless infant meets Rochester criteria, investigate as indicated by history and physical
  - >90 d
    - toxic admit, treat, full septic workup
    - non-toxic and no focus: investigate as indicated by history and physical

FEBRILE SEIZURES
• see Pediatrics, P82

Etiology
• children aged 6 mo-6 yr with fever or history of recent fever
• typical vs. atypical febrile seizures
• normal neurological exam afterward
• no evidence of intracranial infection or history of previous non-febrile seizures
• often positive family history of febrile seizures
• relatively well- looking after seizure

Investigations and Management
• if it is a febrile seizure: treat fever and look for source of fever
• if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
• ± EEG (especially if first seizure), head U/S (if fontanelle open)

Child Abuse and Neglect

- see Pediatrics, P14
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken Baby Syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures age <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

<tr>
<td>Lidocaine w/o epi</td>
<td>max 5 mg/kg SC</td>
<td>Local anesthetic</td>
<td></td>
</tr>
<tr>
<td>Lorazepam</td>
<td>anxiety: 0.5-2 mg PO/IM/IV q6-8h status epilepticus: 4 mg IV repeat up to q5min</td>
<td>Anxiety Status epilepticus</td>
<td></td>
</tr>
<tr>
<td>Midazolam</td>
<td>50 μg/kg IV</td>
<td>Procedural sedation</td>
<td>Short acting benzodiazepine (complication = apnea when used with narcotic) Fentanyl and midazolam often used together for procedural sedation</td>
</tr>
</tbody>
</table>

Presentation of Neglect

- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

Procedures that may Require Sedation

- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/ agitation for imaging/procedures

  - Luteinizing hormone (LH)
  - Follicle-stimulating hormone (FSH)
- Adrenocorticotrophic hormone (ACTH)
- Posterior pituitary
  - Antidiuretic hormone (ADH)*
  - Oxytocin*

**PARATHYROID GLANDS**
- Parathyroid hormone (PTH)

**PANCREAS**
- Insulin
- Glucagon

**OVARIAS**
- Estrogen
- Progesterone

**Dyslipidemias**

**Definition**
- metabolic disorders characterized by elevations of fasting plasma LDL-cholesterol, and/or triglycerides (TG), and/or low HDL-cholesterol

**Overview of Lipid Transport**
- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apoproteins, and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme co-factors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle

SECONDARY HYPERTRIGLYCERIDEMIA

Etiology
- endocrine: obesity/metabolic syndrome, hypothyroidism (more for high LDL, not TG), acromegaly, Cushings syndrome, DM
- renal: chronic renal failure, polycystic and monoclonal hypergammaglobulinemia
- hepatic: chronic liver disease, hepatitis, glycogen storage disease
- drugs: alcohol, corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, beta-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
- other: pregnancy

Hypercholesterolemia

</tbody>
</table>

SECONDARY HYPERCHOLESTEROLEMIA

Etiology
- endocrine: hypothyroidism
- renal: nephrotic syndrome
- immunologic: monoclonal gammopathy
- hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)
- nutritional: diet, anorexia nervosa
- drugs: cyclosporin, anabolic steroids, carbamazepine

<td>Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present</td>
</tr>
</tbody>
</table>
SECONDARY CAUSES

Etiology
• endocrine: obesity/metabolic syndrome, DM
• drugs: β-blockers, benzodiazepines, anabolic steroids
• other: acute infections, inflammatory conditions

Dyslipidemia and the Risk for Coronary Artery Disease

• increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
• increased HDL is associated with decreased cardiovascular disease and mortality
• moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women
• treatment of hypertriglyceridemia has not been shown to reduce CAD risk

Screening
• screen men over age 40, women over age 50 or post-menopausal
• if following risk factors present, screen at any age
  • DM
  • current cigarette smoking or COPD
  • HTN (sBP >140, dBP >90)
  • obesity (BMI >27 kg/m²)
  • family history of premature CAD
  • clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  • evidence of atherosclerosis
  • inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
  • HIV infection on highly active anti-retroviral therapy (HAART)
  • chronic kidney disease (estimated GFR <60 mL/min/1.73 m²)
  • erectile dysfunction
  • screen children with a family history of hypercholesterolemia or chylomicronemia

Factors Affecting Risk Assessment
• metabolic syndrome
• apolipoprotein B (apo B)
  • each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of apo B
  • serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
• C-reactive protein (hs-CRP) levels
• highly sensitive acute phase reactant
• may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

Treatment of Dyslipidemias

Approach to Treatment
For clinical guidelines see Can J Cardiol 2012;28:101-167
• estimate 10 yr risk of CAD using Framingham model
• establish treatment targets according to level of risk

Table 5. Target Lipids by Risk Group

<table>

Simvastatin to Lower CAD Risk – The Heart Protection Study (HPS) 
Lancet 2002;360:797-82

Study: Randomized, double-blind, placebo-controlled trial (median follow-up 5.0 yr).
Patients: 20,536 patients with coronary disease, other occlusive arterial disease or DM aged 40-80 yrs who had a total cholesterol level of ≥3.5 mmol/L.
Intervention: Simvastatin 40 mg/d or placebo.
Main Outcome: Mortality, fatal or non-fatal vascular events.
Results: The use of simvastatin significantly decreased total mortality (12.9 vs. 14.1, p=0.0003) and the first event rate of any cardiovascular event by 25% (p=0.0001).
Conclusion: Treatment with simvastatin improved survival and cardiovascular outcomes in high-risk CAD patients.
Disorders of Glucose Metabolism

Overview of Glucose Regulation

Figure 3. Blood glucose regulation

Pre-Diabetes (Impaired Glucose Tolerance/Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance
- increased risk of developing macrovascular complications (IGT >IFG)
- lifestyle modifications decrease progression to DM by 58%

Diagnostic Criteria (CDA Guidelines)

- impaired fasting glucose (IFG): fasting plasma glucose (FPG) 6.1-6.9 mmol/L
- impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 7.8-11.0 mmol/L
- HbA1c: 6.0-6.4%

Three Year Efficacy of Complex Insulin Regimens in Type 2 DM: 4T Trial

Study: Randomized unblinded trial with 3 yr of follow-up.
Population: 708 patients with type 2 DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.
Intervention: Twice-daily prandial insulin aspart, versus twice-daily bolus insulin aspart, versus once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regimen specific to each arm if there was persistent hyperglycemia.
Primary Outcome: Three yr hemoglobin HbA1c.
Results: Significant difference in rates of patient withdrawal from the study: 5.1% bippionic, 11.7% prandial, 8.5% basal regimens (p=0.04). There were no significant differences in median HbA1c levels between all three arms from yr 1-3. A smaller proportion of patients reached HbA1c < 6.5% or < 7.0% in the biphasic arm. The basal arm had least weight gain and least weight circumference increase, but highest rate of secondary insulin requirement. The basal arm had lowest severe hypoglycemic events per patient yr, while the biphasic arm had the most serious adverse effects.
Conclusion: Basal insulin regimen provides the best glycemic control over a 3 yr study; with better HbA1c control, fewer hypoglycemic events, and less weight gain.
Disorders of Glucose Metabolism

Diabetes Mellitus

Definition
- syndrome of disordered metabolism and inappropriate hyperglycemia secondary to an absolute/relative deficiency of insulin, or a reduction in biological effectiveness of insulin, or both

Diagnostic Criteria (CDA Guidelines)
- any one of the following is diagnostic
  - FPG ≥7.0 mmol/L (fasting = no caloric intake for at least 8 h) OR
  - 2h 75 g OGTT ≥11.1 mmol/L OR
  - random PG ≥11.1 mmol/L OR
  - HbA1c ≥6.5% (not for diagnosis of suspected Type 1 DM, children, adolescents, or pregnant women)
- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision.), a confirmatory test is not required
- in the absence of hyperglycemic symptoms, a repeat confirmatory test is required to make the diagnosis of diabetes

Etiology and Pathophysiology

Table 7. Etiologic Classification of Diabetes Mellitus

<table>
<thead>
<tr>
<th>I. Type 1 DM</th>
<th>Immune-mediated β cell destruction, usually leading to absolute insulin deficiency</th>

Blood Glucose Control in Type 2 DM – UKPDS 33

Lancet 1998;352:837-853

Study: RCT (mean follow-up 10 yr).

Patients: 3,887 patients with newly diagnosed type 2 DM (mean age 53 yr, 67% men, 81% white, mean fasting plasma glucose (FPG) 6.1-15.0 mmol/L).

Exclusions included severe cardiovascular disease, renal disease, retinopathy, and others.

Intervention: Intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L) vs. conventional treatment with diet alone (target FPG <15 mmol/L without hyperglycemic symptoms).

Main Outcomes: DM-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia), DM-related death, and all-cause mortality.

Results: Patients allocated to intensive treatment had lower median HbA1c levels (p<0.001).

Outcome RRR % (p value)

DM-related endpoint 12 (0.029)
DM-related death 10 (0.34)
All-cause mortality 6 (0.44)

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.

Conclusions: Intensive blood glucose control reduces microvascular, but not macrovascular complications in type 2 DM.

**Treatment of Diabetes**

**Glycemic Targets**
- HbA1c reflects glycemic control over 3 mo and is a measure of patient’s long-term glycemic control.
- Therapy in most individuals with type 1 or type 2 DM (especially younger patients) should be targeted to achieve a HbA1c <7.0% in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications.
- More intensive glucose control, HbA1c <6.5%, may be targeted in type 2 DM in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia.
- Less stringent HbA1c targets (7.1-8.5%) may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to attain HbA1c <7.0% despite intensified basal and bolus insulin therapy.
- There may be harm associated with strategy to target HbA1c <6.0% (see ACCORD trial, E9).

**Diet**
- Daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy.
- Intake of saturated fats <7% and polyunsaturated fats <10% of total calories each.
- Limit sodium, alcohol, and caffeine intake.
- Type 1: carbohydrate counting is used to titrate insulin regimen.
- Type 2: weight reduction.

**Cardiovascular Effects of Intensive Lifestyle Intervention in Type 2 DM: The Look AHEAD Trial**

- **Study:** RCT, with 8.6 yr of median follow-up.
- **Population:** 5,145 overweight or obese patients with type 2 DM.
- **Intervention:** Intensive lifestyle intervention promoting weight loss through decreased caloric intake and increased physical activity (intervention) or DM support and education (control).
- **Primary Outcome:** First occurrence of death from cardiovascular (CV) causes, non-fatal MI, non-fatal stroke, or hospitalization for angina.
- **Results:** Although the intensive lifestyle intervention produced greater weight loss and reductions in glycated hemoglobin, the intervention did not significantly reduce the risk of CV morbidity or mortality.
- **Conclusions:** An intensive lifestyle intervention focusing on weight loss did not significantly reduce the risk of cardiovascular events in overweight or obese adults with type 2 DM.
Lifestyle
• regular physical exercise to improve insulin sensitivity, lower lipid concentrations and control blood pressure
• smoking cessation

Medical Treatment: Non-insulin Antihyperglycemic Agents (Type 2 DM)
• initiate non-insulin antihyperglycemic therapy within 2-3 mo if lifestyle management does not result in glycemic control
• if initial HbA1c >8.5% at the time of diagnosis, initiate pharmacologic therapy with metformin immediately and consider combination of therapies or insulin immediately
• continue to add additional pharmacologic therapy in a timely fashion to achieve target HbA1C within 3-6 months of diagnosis
• see Common Medications, E49 for details on antihyperglycemic agents

Medical Treatment: Insulin (Figure 5)
• used for type 1 DM at onset, may be used in type 2 DM at any point in treatment
• routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
• bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin glulisine, Insulin lispro)
• basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, glargine)
• premixed insulins (combination of basal and bolus insulins) available but not used regularly
• estimated total daily insulin requirement: 0.5-0.7 units/kg (often start with 0.3-0.5 units/kg/d)

Effects of Intensive Glucose Lowering in Type 2 DM: The ACCORD Trial
- NEJM 2009;360:2183-2201
Study: Multicenter RCT.
Population: 7,833 patients (mean age 63.2) with type 2 DM, and cardiovascular risk factors.
Intervention: Intensive therapy targeting a HbA1c level of less than 6.0% or standard therapy targeting 7.0-7.9%.
Outcomes: First occurrence of nonfatal MI, nonfatal stroke, or death from CV causes.
Results: The intensive therapy arm was stopped early (7.5 yr vs. 5.5 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV mortality, nonfatal MI, and CHF in the intensive therapy group. There were increased rates of all hypoglycemic events, any nonhypoglycemic serious adverse events, fluid retention, and weight gain >10 kg, but lower systolic and diastolic blood pressure in the intensive therapy group. There was an increased incidence of elevated ALT (>3x upper limit) and ACE drug use in the standard therapy group.
Conclusions: Intensive glucose lowering therapy in type 2 DM does not improve clinical outcomes and actually increases the risk of mortality with more adverse events compared to standard therapy. Additional research is required to discern the cause.

Effects of Intensive Blood Pressure Control in Type 2 DM: The ACCORD Trial
- NEJM 2010;362:1575-1585
Study: RCT, unblinded by 4 yr of mean follow-up.
Population: 4,733 patients with type 2 DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (SBP) between 130-180 mmHg.
Intervention: SBP control less than 120 mmHg (intensive) or 140 mmHg (standard).
Primary Outcomes: Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).
Results: Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI 3.2-3.6) versus 2.1 (95% CI 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.2% vs. 1.7%, p < 0.001); especially atrial fibrillation or atrial tachycardia (0.5% vs. 0.3%, p = 0.02) and hyperkalemia (0.4% vs. 0.0%, p = 0.01). There was no significant difference in primary outcomes in the two study arms, all-cause mortality. There was a significant reduction in any stroke (0.32% vs. 0.33%, p = 0.01) and nonfatal stroke (1.5% vs. 0.4%, p = 0.04) and nonfatal MI (3.4% vs. 3.5%, p = 0.04). There was no significant difference in primary outcomes in the two study arms, all-cause mortality.
Conclusions: Intensive BP lowering to less than 120 mmHg vs. 140 mmHg in patients with type 2 DM and CV risk factors does not reduce major CV event risk reduction except for stroke events.

Variable Insulin Dose Schedule (“Supplemental/Correction Scale”)
- for patients on Basal-Bolus regimen: patient takes usual doses of basal insulin but varies doses of bolus insulin based on BG reading at time of dose
- use baseline bolus insulin dose when within BG target range; add or subtract units when above or below target
- when used in hospital (including perioperative management of DM), patient should also receive basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia
- construction of a supplemental sliding scale for a patient on anti-hyperglycemics
- Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD)
  - BG <4: call MD and give 15 g carbohydrates
  - BG between 4 to 8: no additional insulin
  - BG between 8 to (8 + CF): give one additional unit
  - BG between (8 + CF) to (8 + 2CF): give two additional units
  - BG between (8 + 2CF) to (8 + 3CF): give three additional units

Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)
- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected
- coverage available for insulin pumps for individuals with Type 1 DM varies by province

**All Ketonemia is not DKA**
Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see Cardiology and Cardiac Surgery, C32)
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in type 2 DM
- most patients with DM are considered “high risk” under the risk stratification for CAD (see Dyslipidemias, E5)
- ischemic stroke (see Neurology, N50)
  - risk of stroke is approximately 2.5x higher in those with DM
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see Vascular Surgery, VS2)
  - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- treatment
  - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight low density lipoprotein (LDL) cholesterol control (LDL ≤2.0 mmol/L)
  - ACEI or angiotensin receptor blocker in high-risk patients
  - smoking cessation

Microvascular Complications

DIABETIC RETINOPATHY (see Ophthalmology, OP33 for a more detailed description)

Epidemiology
- type 1 DM: 25% affected at 5 yr, 100% at 20 yr
- type 2 DM: 25% affected at diagnosis, 60% at 20 yr
- leading cause of blindness in North America between the ages of 20-74
- most important factor is disease duration

Clinical Features
- nonproliferative
- preproliferative
- proliferative

Treatment and Prevention
- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- ophthalmological treatments available – see Ophthalmology, OP33 for more details
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of type 2 DM; 5 yr after diagnosis of type 1 DM)
- interval for follow-up should be tailored to severity of retinopathy

DIABETIC NEPHROPATHY (see Nephrology, NP31 for a more detailed description)

Epidemiology
- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with type 1 DM (after 5-10 yr) and 4-20% with type 2 DM have progressive nephropathy

Screening
- serum creatinine
- random urine test for albumin to creatinine ratio (ACR) plus urine dipstick test for all type 2 DM patients at diagnosis, then annually, and for postpubertal type 1 DM patients with ≥5yr duration of DM

Treatment and Prevention
- appropriate glycemic control
- appropriate blood pressure control (<130/80 mmHg)
- use either ACEI or ARB (often used first line for their CVD protection)
- limit use of nephrotoxic drugs and dyes

Average fluid loss runs at 3-6 L in DKA, and 8-10 L in HHS

Laboratory Testing: Ketones
The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect β-hydroxybutyrate (BHB), the ketone most frequently in excess. This has two clinical consequences:

- Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB
- As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving

Empagliflozin, Cardiovascular Outcomes, and Mortality in Type 2 Diabetes

NEJM 2015;373:2117-2128

Purpose: To examine whether Empagliflozin (an SGLT2 inhibitor) has any effect on cardiovascular risk in patients with Type 2 DM.

Study: Multi-centre RCT comparing Empagliflozin to placebo control; 7020 patients (test N=4687, placebo N=2333), median observation 3.1 yr.

Outcome: Death from cardiovascular causes, nonfatal MI, or nonfatal stroke.

Results:
- Both groups concurrently received the standard treatment for T2 DM. The Empagliflozin group had significantly lower rates of death from cardiovascular causes than control (3.7%, vs. 5.9%; 30% decreased relative risk). The test group also had lower all-cause mortality (5.7% vs. 8.3%, respectively; 32% decreased relative risk).

Conclusion: Adding Empagliflozin to standard treatment for Type 2 DM reduced death from macrovascular complications and all-cause mortality when compared to placebo.
DIABETIC NEUROPATHY

Epidemiology
- approximately 50% of patients within 10 yr of onset of type 1 DM and type 2 DM

Pathophysiology
- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
- the more common motor and sensory neuropathies are thought to be related to metabolic or osmotic toxicity secondary to increased sorbitol and/or decreased myoinositol (possible mechanisms include accumulation of advanced glycation endproducts [AGE], oxidative stress, protein kinase C, nerve growth factor deficiency)

Screening
- 128 Hz tuning fork or 10 g monofilament at diagnosis and annually in people with type 2 DM and after 5 yr duration of type 1 DM

Clinical Features

Table 13. Clinical Presentation of Diabetic Neuropathies

<table>
<thead>
<tr>
<th>Peripheral Sensory Neuropathy</th>
<th>Motor Neuropathy</th>
<th>Autonomic Neuropathy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parasthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation</td>
<td>Less common than sensory neuropathy</td>
<td>Postural hypotension, tachycardia, decreased cardiovascular response to Valsalva maneuver</td>
</tr>
<tr>

<td>Some of the motor neuropathies spontaneously resolve after 6-8 wk</td>
<td></td>
</tr>
<tr>
<td>May result in neuropathic ulceration of foot</td>
<td>Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell’s palsy)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Diabetic amyotrophy: refers to pain, weakness, and wasting of hip flexors or extensors</td>
<td></td>
</tr>
</tbody>
</table>

Treatment and Management
- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst™ fitted stocking and tilting of bed of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
- medical, mechanical, and surgical treatment for erectile dysfunction (see Urology, U30)

Other Complications

Dermatologic
- diabetic dermopathy: atrophic brown spots commonly in pretilial region known as “skin spots”, secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabeticorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

Bone and Joint Disease
- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren’s contracture
- bone demineralization: bone density 10-20% below normal
- adhesive capsulitis (“frozen shoulder”)

Cataracts
- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

Infections
- see Infectious Diseases, ID15
Hypoglycemia (BG <4.0 mmol/L or 72 mg/dL)

Etiology and Pathophysiology
- Hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- In people without DM, care must be taken to distinguish fasting from post-prandial hypoglycemia as each invokes separate differential diagnoses

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Clinical Features
- Whipple’s triad
  1. Serum glucose <2.5 mmol/L in males and <2.2 mmol/L in females
  2. Neuroglycopenic symptoms
  3. Rapid relief provided by administration of glucose
- Adrenergic symptoms (typically occur first; caused by autonomic nervous system activity)
  - Palpitations, sweating, anxiety, tremor, tachycardia
- Neuroglycopenic symptoms (caused by decreased activity of CNS)
  - Dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

Investigations
- Electrolytes, creatinine, LFTs, drugs/toxins, cortisol
- If concerned about possible insulinoma:
  - Blood work to be drawn when patient is hypoglycemic (e.g. during hospitalized 72-h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

Treatment
- For fasting hypoglycemia, must treat underlying cause
- For post-prandial (reactive) hypoglycemia, frequent small feeds
- See Emergency Medicine, ER35
- Treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV or 1 mg glucagon SC (if no IV available)
  - Blood work to be drawn when patient is hypoglycemic (e.g. during hospitalized 72-h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

Metabolic Syndrome
- Several definitions exist
- Postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- Obesity aggravates extent of insulin resistance
- Complications include DM, atherosclerosis, CAD, MI, and stroke
- Women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- Not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

Obesity
- See Family Medicine, FM7
**Pituitary Gland**

**Pituitary Hormones**

![Diagram of Pituitary Gland and Hormones]

**Hypothalamic Control of Pituitary**
- Trophic and inhibitory factors control the release of pituitary hormones.
- Most hormones are primarily under trophic stimulation except prolactin which is primarily under inhibitory control by dopamine, as well as GH and TSH which are inhibited by somatostatin.
- Transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones.

**Anterior Pituitary Hormones**
- Growth hormone (GH), luteinizing hormone (LH), follicle-stimulating hormone (FSH), thyroid-stimulating hormone (TSH), adrenocorticotropic hormone (ACTH), and prolactin (PRL).

**Posterior Pituitary (Hypothalamic) Hormones**
- Antidiuretic hormone (ADH) and oxytocin.
- Peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus.
- Although ADH and oxytocin are produced in the hypothalamus, these hormones are stored and released from the posterior pituitary.

**Table 15. The Physiology and Action of Pituitary Hormones**

</tr>
</tbody>
</table>

**Features of Metabolic Syndrome**

- Level of 3 measures to make a Dx:
  - Abdominal Obesity (Elevated Waist Circumference): Men ≥ 102 cm (40 inches); Women ≥ 88 cm (35 inches)
  - HDL C Level: Men < 1.0 mmol/L (<40 mg/dL); Women < 1.3 mmol/L (<50 mg/dL)
  - Blood Pressure: ≥ 130/85 mmHg
  - Fasting Glucose Level: Men ≥ 5.6 mmol/L (>100 mg/dL)

Drugs treatment for any elevated marker is an alternate indicator.

</table>

**Growth Hormone**

**GH DEFICIENCY**
- cause of short stature in children (see *Pediatrics*, P26)
- controversial significance in adults; often not clinically apparent, may present as fatigue

**GH EXCESS**

**Etiology**
- GH secreting pituitary adenoma, carcinoid or pancreatic islet tumours secreting ectopic GHRH resulting in excess GH

**Pathophysiology**
- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in growth hormone excess states, secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

**Clinical Features**
- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly
- enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, thickening of skin, increased sebum production, sweating, acne, sebaceous cysts, fibromata mollusca, acanthosis nigricans, arthralgia, carpal tunnel syndrome, degenerative osteoarthritis, barrel chest, thyromegaly, renal calculi, HTN, cardiomyopathy, obstructive sleep apnea, colonic polyps, erectile dysfunction, menstrual irregularities, and DM

**Risks Associated with GH Excess**
- Cardiac disease (e.g. CAD, cardiomegaly, cardiomyopathy) in 1/3 of patients, with a doubling of risk of death from cardiac disease
- HTN in 1/3 of patients
- Risk of cancer (particularly GI) increased 2-fold to 3-fold
Investigations
- elevated serum insulin-like growth factor-1 (IGF-1) is usually the first line diagnostic test
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening, enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

Treatment
- surgery, octreotide (somatostatin analogue), dopamine agonist (bromocriptine/cabergoline), growth hormone receptor antagonist (pegvisomant), radiation

Prolactin

HYPERPROLACTINEMIA

Etiology
- pregnancy and breastfeeding
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumours may be induced by estrogens and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, anti-hypertensives, anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H₂-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big big prolactin)

Clinical Features
- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, erectile dysfunction

Investigations
- serum PRL, TSH, liver enzyme tests, creatinine, macroprolactin level in select cases
- MRI of the sella turcica in select cases

Treatment
- long-acting dopamine agonist: bromocriptine, cabergoline, or quinagolide
- surgery ± radiation (rare)
- prolactin-secreting tumours are often slow-growing and sometimes require no treatment
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

Thyroid Stimulating Hormone
- see Thyroid, E20

Adrenocorticotropic Hormone
- see Adrenal Cortex, E29

Luteinizing Hormone and Follicle Stimulating Hormone

HYPOGONADOTROPIC HYPOGONADISM

Etiology
- primary/congenital: Kallmann syndrome, CHARGE syndrome, GnRH insensitivity
- secondary: CNS or pituitary tumours, pituitary apoplexy, brain/pituitary radiation, drugs (GnRH agonists/antagonists, glucocorticoids, narcotics, chemotherapy, drugs causing hyperprolactinemia), functional deficiency due to another cause (hyperprolactinemia, chronic systemic illnesses, eating disorders, hypothyroidism, DM, Cushing's disease), systemic diseases (hemochromatosis, sarcoidosis, histiocytosis)

Approach to Nipple Discharge
- Differentiate between galactorrhea (fat droplets present) versus breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation, stress) versus pathologic
- If abnormal breast discharge, must rule out a breast malignancy
Clinical Features
• hypogonadism, amenorrhea, erectile dysfunction (see Urology, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development

Treatment
• combined FSH/LH hormone therapy, hCG, rFSH, or pulsatile GnRH analogue if fertility desired
• symptomatic treatment with estrogen/testosterone

HYPERGONADOTROPIC HYPOGONADISM
• hypogonadism due to impaired response of the gonads to FSH and LH

Etiology
• congenital:
  ■ chromosomal abnormalities (Turner’s syndrome, Klinefelter syndrome, XX gonadal dysgenesis)
  ■ enzyme defects (17α-hydroxylase deficiency, 17, 20-lyase deficiency)
  ■ gonadotropin resistance (Leydig cell hypoplasia, FSH Insensitivity, pseudohypoparathyroidism type 1A)
• acquired:
  ■ gonadal toxins (chemotherapy, radiation)
  ■ drugs (glucocorticoids, antiandrogens, opioids, alcohol)
  ■ infections (STIs, Mumps)
  ■ gonadal failure in adults (androgen decline and testicular failure in men, premature ovarian failure and menopause in women)

Clinical Features
• hypogonadism, amenorrhea, erectile dysfunction (see Urology, U30), loss of body hair, fine skin, testicular atrophy, failure of pubertal development, low libido, infertility

Treatment
• hormone replacement therapy consisting of androgen (for males) and estrogen (for females) administration

**Antidiuretic Hormone**

**DIABETES INSIPIDUS**

**Definition**
• disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

**Etiology and Pathophysiology**
• central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, stalk lesion, hydrocephalus, histiocytes X, trauma, familial central DI
• nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
• psychogenic polydipsia and osmotic diuresis must be ruled out

**Clinical Features**
• passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism

**Diagnostic Criteria**
• fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
• response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

**Treatment**
• DDAVP/vasopressin for central DI
• chlorpropamide, clofibrate, thiazides, NSAIDs, or carbamazepine as second line or for partial DI
• nephrogenic DI treated with solute restriction NSAIDs and thiazide diuretics; DDAVP (if partial)

**SYNDROME OF INAPPROPRIATE ADH SECRETION**

**Diagnostic Criteria**
• hyponatremia with corresponding plasma hypo-osmolality, urine sodium concentration above 40 mEq/L, urine less than maximally diluted (>100 mOsml/kg), euvoemia (edema absent), and absence of adrenal, renal, or thyroid insufficiency
Etiology and Pathophysiology
- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (TB, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

Clinical Features
- symptoms of hyponatremia: headaches, nausea, vomiting, muscle cramps, tremors, cerebral edema If severe (confusion, mood swings, hallucinations, seizures, coma)

Treatment
- treat underlying cause, fluid restriction (800-1000 mL/day), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), and demeclocycline (antibiotic with anti-ADH properties, rarely-used) fluoroisotone, furosemide

Pituitary Pathology

PITUITARY ADENOMA (see Neurosurgery, NS13)

Clinical Features
- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies), headaches; increased ICP is rare
  - hypofunction
    - hypopituitarism
    - hyperfunction
      - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing’s disease = Cushing’s syndrome caused by a pituitary tumour)
      - tumours secreting LH, FSH, and TSH are rare

Investigations
- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing
- hypothalamic-pituitary hormonal function

HYPOPITUITARISM

Etiology (The Eight Is)
- Invasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke’s cleft, arachnoid, or dermoid), metastases
- Infarction/hemorrhage
  - Sheehan’s syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered level of consciousness; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
  - syphilis, TB, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
  - severe head trauma
- Immunologic
  - autoimmune destruction
- Iatrogenic
  - following surgery or radiation
- Idiopathic
  - familial forms, congenital midline defects

Clinical Features
- symptoms depend on which hormone is deficient:
  - ACTH: fatigue, weight loss, hypoglycemia, anemia, hyponatremia, failure to thrive and delayed puberty in children
  - GH: short stature in children
  - TSH: tiredness, cold intolerance, constipation, weight gain, hair loss
  - LH and FSH: oligo- or amenorrhea, infertility, decreased facial/body hair and muscle mass in men, delayed puberty
  - Prolactin: inability to breastfeed
  - ADH: symptoms of diabetes insipidus (extreme thirst, polydipsia, hypernatremia)
  - Oxytocin: usually asymptomatic - only needed during labour and breastfeeding

SIADH vs. Cerebral Salt Wasting (CSW)
CSW can occur in cases of subarachnoid hemorrhage. Na⁺ is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

Presentations of Pituitary Lesions
- Mass effect (visual field deficits, diplopia, ptosis, headaches, CSF leak)
- Hyperfunction
- Hypofunction

Important Deficiencies to Recognize are:
- Adrenal insufficiency
- Hypothyroidism
- Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

The Pituitary Hormones
Order they are usually lost with compression by a mass:
“Go Look For The Adenoma Phrase”
GH, LH, FSH, TSH, ACTH, PRL + posterior pituitary hormones: ADH and oxytocin
**Investigations**
- triple bolus test
  - stimulates release of all anterior pituitary hormones in normal individuals
  - rapid sequence of IV infusion of insulin, GnRH, and TRH
  - insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and ACTH/cortisol
  - GnRH (100 µg IV push) → increased LH and FSH
  - TRH (200 µg IV push over 120 s) → increased TSH and PRL (no longer available in Canada)
  - GnRH and TRH stimulation tests are very limited in their utility; the insulin tolerance test is the only truly useful test in the triple bolus assessment

---

**Thyroid Hormones**

**Synthetic Function of Thyroid Gland**
- the synthesis of thyroid hormones $T_3$ (thyroxine) and $T_4$ (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, digestion of thyroglobulin, and release of $T_3$ and $T_4$
- free $T_3$ (0.03%) and free $T_4$ (0.3%) represent the hormonally active fraction of thyroid hormones
  - the remaining fraction is bound to thyroxine binding globulin (TBG) and albumin and is biologically inactive
- $T_3$ is more biologically active (3-8x more potent), but $T_4$ has a longer half-life
- 85% of $T_4$ is converted to $T_3$ or reverse $T_3$ (RT3) in the periphery by deiodinases
- RT3 is metabolically inactive but produced in times of stress to decrease metabolic activity
- most of the plasma $T_3$ pool is derived from the peripheral conversion of $T_4$
- calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells
  - it functions by inhibiting osteoclast activity and increasing renal calcium excretion

**Role of Thyroid Hormones**
- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, effecting nearly every organ system
- they increase the basal metabolic rate including: increased Na⁺/K⁺-ATPase activity, increased $O_2$ consumption, increased respiration, heat generation, and increased cardiovascular activity
- also play crucial role during fetal life in both neurological and somatic development

---

Regulation of Thyroid Function
- extrathyroid
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators)
  - T3 negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- intrathyroid (autoregulation)
  - synthesis (Wolf-Chaikoff effect, Jod-Basedow effect)
  - there is varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of T3 to T4 in iodide deficiency
  - increased activity of peripheral 5’ deiodinase in hypothyroidism increases T3 production despite low T4 levels

Tests of Thyroid Function and Structure

TSH
- sensitive TSH (sTSH) is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating T3 and T4
  - secondary: increased TSH results in increased T3 and T4
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from T3 and T4
  - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

Free T3 and Free T4
- standard assessment of thyroid function measures TSH and if necessary free T4. Free T3 should only be measured in the small subset of patients with hyperthyroidism and suspected T3 toxicity. TSH would be suppressed, free T4 normal, and free T3 elevated

Thyroid Autoantibodies
- thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies (TPOAb), and TSH receptor antibodies (TRAb) of the blocking variety are increased in Hashimoto’s disease; normal variant in 10-20% of individuals
- TRAb of the stimulating variety are also referred to as thyroid stimulating immunoglobulins (TSI) and cause Graves’ disease. However, both TRAb receptor blocking and stimulating antibodies are seen in patients with Graves’ disease

Plasma Thyroglobulin
- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- normal or elevated levels may suggest persistent, recurrent, or metastatic disease

Serum Calcitonin
- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma or family history of MEN IIa or IIb syndromes
  - used to monitor for residual or recurrent medullary thyroid cancer

Thyroid Imaging/Scans
- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, solid vs. cystic nodule, facilitate fine needle aspirate biopsy (FNAB)
  - radioisotope thyroid scan (Technetium-99)
- test of structure: order if there is a thyroid nodule and patient is hyperthyroid with low TSH
  - differentiates between hot (functioning → excess thyroid hormone production) and cold (non-functioning) nodules
    - hot nodule → very low chance malignancy; treat hyperthyroidism
    - cold nodule → ~5% chance malignancy; further workup required (U/S and FNAB)
- radioactive iodine uptake (RAIU)
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland in vivo
  - if uptake (i.e. incorporated), gland is overactive (hyperthyroid)
  - if 1 uptake (i.e. not incorporated), gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
  - see Figure 9, Approach to the Evaluation of a Thyroid Nodule, E28 for further information regarding the utility of these scans

Thyroid Biopsy
- fine needle aspiration (FNA) for cytology
  - differentiates between benign and malignant disease
  - best done under U/S guidance
  - accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

**Caution with Amiodarone**

Amiodarone-Induced Hypothyroidism (AIIH):
- AIIH occurs more often in iodine-sufficient areas, and is more common in populations with a higher prevalence of autoimmune thyroid disease, such as women and the elderly. AIIH can also occur in patients without pre-existing thyroid dysfunction.

Amiodarone-Induced Thyrotoxicosis (AIT):
- AIT occurs more often in iodine-deficient areas. It may occur in patients with pre-existing thyroid deficiencies, as an iodine load on an already dysfunctional thyroid may result in excessive thyroid hormone synthesis and release. AIT may also occur in patients without thyroid abnormalities through a cytotoxic mechanism that results in leakage of thyroid hormone into the systemic circulation.

**Signs and Symptoms of HYPERthyroidism**

Tremor  
Heart rate up  
Yawning (fatigued)  
Restlessness  
Oligomenorrhea/amenorrhea  
Intolerance to heat  
Diarrhea  
Irritability  
Sweating  
Muscle wasting/weight loss

**Common Etiologies**

</table>

Treatment
- thionamides: propylthiouracil (PTU) or methimazole (MMI); MMI recommended (except in first trimester pregnancy)
- β-blockers for symptom control
- radioactive iodine thyroid ablation for Graves’ disease
- surgery in the form of hemi, sub-total, or complete thyroidectomy

Graves’ Disease

Definition
- an autoimmune disorder characterized by autoantibodies to the TSH receptor that leads to hyperthyroidism

Epidemiology
- most common cause of thyrotoxicosis
- occurs at any age with peak in 3rd and 4th decade
- F:M = 7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves’ disease and 50% have family members with positive circulating antibodies
- association with HLA B8 and DR3
- may be associated with other inherited autoimmune disorders (e.g. pernicious anemia, Hashimoto’s disease)

Etiology and Pathophysiology
- autoimmune disorder due to a defect in T-suppressor cells
- B lymphocytes produce TSI that binds and stimulates the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, lithium therapy, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) is a result of increased tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and displacement of the eyeball forward
- dermopathy may be related to cutaneous glycosaminoglycan deposition

Clinical Features
- signs and symptoms of thyrotoxicosis
- diffuse thyroid goitre ± thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periocular puffiness, lid lag, decreased visual acuity (plus signs of hyperthyroidism: lid retraction, characteristic stare)
- dermopathy (rare): pretibial myxedema (thickening of dermis that manifests as non-pitting edema)
- acropachy: clubbing and thickening of distal phalanges

Investigations
- low TSH
- increased free T4 (and/or increased T3)
- positive for TSI (specific but not sensitive for Graves’ disease)
- increased radioactive iodine (I-131) uptake
- homogeneous uptake on thyroid scan (only do this test in the presence of nodule)
Treatment
- thionamides: propylthiouracil (PTU) or methimazole (MMI)
  - PTU and MMI inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organization of iodide, blocking the coupling of iodotyrosines
  - PTU also inhibits peripheral deiodination of T4 to T3
  - continue treatment until remission occurs (20-40% of patients achieve spontaneous remission at 6-18 mo of treatment)
- small goitre and recent onset are good indicators for long-term remission with medical therapy
- major side effects: hepatitis, agranulocytosis, and fever/arthritis
- minor side effects: rash
- iotinated contrast agents: sodium ipodate and iopanoic acid can inhibit conversion of T4 to T3 and are especially effective in combination with MMI
- MMI preferred vs. PTU due to longer duration of action (once daily for most), more rapid efficacy, and lower incidence of side effects
- in pregnancy: use PTU during first trimester and MMI during second and third trimester. MMI is contraindicated in the first trimester due to risk of aplasia cutis; MMI is preferred in the second and third trimester due to the potential risk of hepatotoxicity with PTU in the second and third trimesters
- symptomatic treatment with β-blockers
- thyroid ablation with radioactive 131I if PTU or MMI trial does not produce disease remission
- high incidence of hypothyroidism after 131I requiring lifelong thyroid hormone replacement
- contraindicated in pregnancy
- may worsen ophthalmopathy
- subtotal or total thyroidectomy (indicated for large goitres, suspicious nodule for Ca, if patient is intolerant to thionamides and refusing RAI ablation)
- risks include hypoparathyroidism and vocal cord palsy
- ophthalmopathy/orbitopathy
- smoking cessation is important
- prevent drying of eyes
- high dose prednisone in severe cases
- orbital radiation, surgical decompression

Prognosis
- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- lifetime follow-up needed
- risk of relapse is 37%, 21%, 6% in thionamides, radioiodine ablation, and surgery groups, respectively

Subacute Thyroiditis (Thyrotoxic Phase)

Definition
- acute inflammatory disorder of the thyroid gland characterized by an initial thyrotoxic state followed by hypothyroidism eventually followed by euthyroidism in most cases
- two subtypes: painful (“De Quervain’s”) and painless (“Silent”)

Etiology and Pathophysiology
- acute inflammation of the thyroid gland characterized by giant cells and lymphocytes
- disruption of thyroid follicles by inflammatory process results in the release of stored hormone rather than excessive production of new thyroid hormone
- painful = viral (usually preceded by URTI), De Quervain’s (granulomatous thyroiditis)
- painless = postpartum, auto-immune, lymphocytic
  - occurs in 5-10% of postpartum mothers and is symptomatic in 1/3 of patients

Clinical Features
- painful (thyroid, ears, jaw, and occiput) or painless
- fever and malaise may be present, especially in De Quervain’s
- postpartum: thyrotoxicosis 2-3 mo postpartum with a subsequent hypothyroid phase at 4-8 mo postpartum
- may be mistakenly diagnosed as postpartum depression

Laboratory Investigations
- initial elevated free T4, T3, low TSH, RAIU markedly reduced
- marked elevation of ESR in painful variety only
- as disease progresses values consistent with hypothyroidism may appear

Treatment
- painful – high dose NSAIDs, prednisone may be required for severe pain, fever, or malaise
- iotinated contrast agents (e.g. iopanoic acid, ipodate) to inhibit peripheral conversion of T4 to T3
- β-adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms in both subtypes
- if symptomatically hypothyroid, may treat short-term with thyroxine

Prognosis
- full recovery in most cases, but permanent hypothyroidism in 10% of painless thyroiditis
- postpartum: most resolve spontaneously without need for supplementation, however may recur with subsequent pregnancies
**Toxic Adenoma/Toxic Multinodular Goitre**

**Etiology and Pathophysiology**
- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T₃ and T₄
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre [Plummer's disease])

**Clinical Features**
- goitre with adenomatous changes
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- seen most frequently in elderly people, often with presentation of atrial fibrillation

**Investigations**
- low TSH, high T₃ and T₄
- thyroid scan with increased RAIU in nodule(s) and suppression of the remainder of the gland

**Treatment**
- initiate therapy with PTU or MMI to attain euthyroid state
- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- β-blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

**Thyrotoxic Crisis/Thyroid Storm**

**Definition**
- acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism – medical emergency!
- rare, but serious with mortality rate between 10-30%

**Etiology and Pathophysiology**
- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

**Differential Diagnosis**
- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

**Clinical Features**
- hyperthyroidism
- extreme hyperthermia (≥40°C), tachycardia, vomiting, diarrhea, vascular collapse, hepatic failure with jaundice, and confusion
- tachyarrhythmia, CHF, shock
- mental status changes ranging from delirium to coma

**Laboratory Investigations**
- increased free T₃ and T₄, undetectable TSH
- ± anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

**General Measures**
- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or other β-blockers that additionally decrease peripheral conversion of T₃ → T₄ can be used, but should be used with caution in CHF patients as it may worsen condition

**Specific Measures**
- PTU is the anti-thyroid drug of choice and is used in high doses
- Give iodide, which acutely inhibits the release of thyroid hormone, one hour after the first dose of PTU is given
  - Sodium iodide 1 g IV drip over 12h q12h
  - Lugol's solution 2-3 drops q8h
  - Potassium iodide (SSKI) 5 drops q8h
- dexamethasone 2-4 mg IV q6h for the first 24-48 hours lowers body temperature and inhibits peripheral conversion of T₃ → T₄

**Prognosis**
- probably <20% mortality rate if rapidly recognized and treated
Hypothyroidism

Definition
- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

Epidemiology
- 2-3% of general population
- F:M = 10:1
- 10-20% of women over age 50 have subclinical hypothyroidism (normal T4, TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

Etiology and Pathophysiology
- primary hypothyroidism (90%)
  - inadequate thyroid hormone production secondary to intrinsic thyroid defect
  - iatrogenic: post-ablative (¹³¹I or surgical thyroidectomy)
  - autoimmune: Hashimoto’s thyroiditis, chronic thyroiditis, idiopathic, burnt out Graves’
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4,000 births)
- secondary hypothyroidism: pituitary hypothyroidism
  - insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
  - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

</tr>
</tbody>
</table>

Treatment
- L-thyroxine (dose range: 0.05-0.2 mg PO OD ~1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism
  - monitor via measurement of free T4 (TSH is unreliable in this setting)

CONGENITAL HYPOTHYROIDISM
- see Pediatrics, P28
Hashimoto’s Thyroiditis

• most common form of primary hypothyroidism in North America
• chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
• two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
• goitrous variant usually presents with a rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  • associated with fibrosis
• atrophic variant patients are hypothyroid from the start
  • associated with thyroid lymphoma

Etiology and Pathophysiology
• defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
• B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na+/I– symporter

Risk Factors
• female gender (F:M = 7:1)
• genetic susceptibility: increased frequency in patients with Down’s syndrome, Turner’s syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
• family Hx or personal Hx of other autoimmune diseases
• cigarette smoking
• high iodine intake
• stress and infection

Investigations
• high TSH, low T₄ (not necessary to measure T₃ as it will be low as well)
• presence of anti-thyroid peroxidase (TPOAb) and thyroglobulin antibodies (TgAb) in serum

Treatment
• if hypothyroid, replace with L-thyroxine (analog of T₄)

Myxedema Coma

Definition
• severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events – medical emergency!
• rare, high level of mortality when it occurs (up to 40%, despite therapy)

Clinical Features
• hallmark symptoms of decreased mental status and hypothermia; hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized edema often present

Investigations
• decreased T₄, increased TSH, decreased glucose
• check ACTH and cortisol for evidence of adrenal insufficiency

Treatment
• aggressive treatment required
• ABCs: ICU admission
• corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
• L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider T₃ therapy
• supportive measures: mechanical ventilation, vasopressor drugs, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
• monitor for arrhythmia

Sick Euthyroid Syndrome

Definition
• changes in circulating thyroid hormones amongst patients with serious illness, trauma, or stress
• not due to intrinsic thyroid or pituitary disease
• initially low free T₃ may be followed by low TSH and if severe illness low free T₄
• with recovery of illness, TSH may overshoot and become transiently high
Pathophysiology
- abnormalities include alterations in
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
  - thyroid function itself
- may be protective during illness by reducing tissue catabolism

Labs
- initially decreased free T₃ followed by decreased TSH and finally decreased free T₄

Treatment
- treat the underlying disease; thyroid hormone replacement worsens outcomes
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

Non-Toxic Goitre

Definition
- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

Pathophysiology
- the appearance of a goitre is more likely during adolescence, pregnancy, and lactation because of increased thyroid hormone requirements
  - early stages: goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

Etiology
- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

Treatment
- remove goitrogens
- radiiodine therapy (need very high doses given low iodine uptake, used as last resort)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary for severe compressive symptoms

Complications
- compression of neck structures causing stridor, dysphagia, pain, and hoarseness
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

Thyroid Nodules

Definition
- clearly defined discrete mass, separated from the thyroid parenchyma
- palpable nodules are found in approximately 5% of women and 1% of men

Etiology
- benign tumours (e.g. colloid nodule, follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

Investigations

---

Figure 9. Approach to the evaluation of a thyroid nodule
Adapted from Dr. J Goguen, University of Toronto, MINMD 2013
Thyroid Malignancies

- see Otolaryngology, OT34

Adrenal Cortex

Adrenocorticotropic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400; trough: 1800-2400)
- secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
- stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a limited extent, mineralocorticoids
- some melanocyte stimulating activity

Adrenocortical Hormones

Aldosterone
- a mineralocorticoid which regulates extracellular fluid (ECF) volume through Na⁺ (and Cl⁻) retention and K⁺ (and H⁺) excretion (stimulates distal tubule Na⁺/K⁺ ATPase)
- regulated by the renin-angiotensin-aldosterone system (Figure 12)
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone ↑ volume expansion) and short loop (angiotensin II ↑ peripheral vasoconstriction)

Mineralocorticoids
- zona glomerulosa

Glucocorticoids
- zona fasciculata

Sex Steroids
- zona reticularis

Figure 11. Pathways of major steroid synthesis in the adrenal gland and their enzymes

Layers of the Adrenal Cortex
- OUTSIDE
  - Zona Glomerulosa produces mineralocorticoids (aldosterone)
  - Zona Fasciculata produces glucocorticoids (cortisol)
- INSIDE
  - Zona Reticularis produces androgens (DHEA, androstenedione)

Figure 12. Renin-angiotensin-aldosterone axis (see Nephrology, NP4)
Cortisol
- a glucocorticoid, regulated by the HPA axis
- involved in regulation of metabolism; counteracts the effects of insulin
- support blood pressure, vasomotor tone
- also involved in regulation of behaviour and immunosuppression

Table 21. Physiological Effects of Glucocorticoids

Androgens
- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are dihydroepiandrosterone (DHEA), androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age

Adrenocortical Functional Workup

STIMULATION TEST
- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

1. Tests of Glucocorticoid Reserve
- Cosyntropin (ACTH analogue) Stimulation Test
  - give 1 µg or 250 µg cosyntropin IV, then measure plasma cortisol levels at time 0, 30, and 60 min
  - physiologic response: stimulated plasma cortisol of >500 nmol/L
  - inappropriate response: inability to stimulate increased plasma cortisol
- insulin tolerance is the gold standard test used to diagnose adrenal insufficiency (see Pituitary Gland, E15)

SUPPRESSION TESTS
- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

1. Tests of Pituitary-Adrenal Suppressibility
- Dexamethasone (DXM) Suppression Test
  - principle: DXM suppresses pituitary ACTH, plasma cortisol should be lowered if HPA axis is normal
  - Screening Test: Overnight DXM Suppression Test
    - oral administration of 1 mg DXM at midnight measure plasma cortisol levels the following day at 8 am
    - physiologic response: plasma cortisol <50 nmol/L, with 50-140 nmol/L being a "grey zone" (cannot be certain if normal or not)
    - inappropriate response: failure to suppress plasma cortisol
  - Confirmatory Test: Other testing is used to confirm the diagnosis, such as:
    - 24 h urine free cortisol (shows overproduction of cortisol)
    - midnight salivary cortisol (if available), shows lack of diurnal variation
      - inappropriate response: remains high (normally will be low at midnight)

2. Tests of Mineralocorticoid Suppressibility
- principle: expansion of extracellular fluid volume (ECFV); plasma aldosterone should be lowered if HPA axis is normal
- ECFV Expansion with Normal Saline (NS)
  - IV infusion of 500 mL/h of NS for 4 h, then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L is consistent with primary hyperaldosteronism, <140 pmol/L is normal
  - inappropriate response: failure to suppress plasma aldosterone
**Mineralocorticoid Excess Syndromes**

**Figure 13. Approach to mineralocorticoid excess syndromes**

**Definition**
- Primary hyperaldosteronism (PH): excess aldosterone production (intra-adrenal cause)
- Secondary hyperaldosteronism (SH): aldosterone production in response to excess RAAS (extra-adrenal cause)

**Etiology**
- **Primary hyperaldosteronism**
  - Aldosterone-producing adrenal adenoma (Conn’s syndrome)
  - Bilateral or idiopathic adrenal hyperplasia
  - Glucocorticoid-remediable aldosteronism
  - Aldosterone-producing adrenocortical carcinoma
  - Unilateral adrenal hyperplasia
- Secondary hyperaldosteronism

**Clinical Features**
- HTN
- Hypokalemia (may have mild hypernatremia), metabolic alkalosis
- Normal K⁺, low Na⁺ in SH (low effective circulating volume leads to ADH release) edema
- Increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, MI
- Fatigue, weakness, paresthesia, headache; severe cases with tetany, intermittent paralysis

**Diagnosis**
- Investigate plasma aldosterone to renin ratio in patients with HTN and hypokalemia
- Confirmatory testing for PH: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECF volume expansion)
- Imaging: CT adrenal glands

**Table 22. Diagnostic Tests in Hyperaldosteronism**

<table>
<thead>
<tr>
<th>Test</th>
<th>Primary Hyperaldosteronism</th>
<th>Secondary Hyperaldosteronism</th>
</tr>
</thead>

<tr>
<td>B) IV saline test</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Treatment**
- Inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- Surgical excision of adrenal adenoma
- Secondary hyperaldosteronism: treat underlying cause
Cushing’s Syndrome

Definition
• results from chronic glucocorticoid excess (endogenous or exogenous sources)

Etiology
• ACTH-dependent (85%) – bilateral adrenal hyperplasia and hypersecretion due to:
  ■ ACTH-secreting pituitary adenoma (Cushing’s disease; 80% of ACTH-dependent)
  ■ ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumours)
• ACTH-independent (15%)
  ■ long-term use of exogenous glucocorticoids
  ■ primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  ■ bilateral adrenal nodular hyperplasia

Clinical Features
• symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
• signs: central obesity, round face, supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism if ACTH-dependent

Diagnosis
• complete a drug history to exclude iatrogenic Cushing’s
• perform one of: 1) 24 h urine free cortisol, 2) dexamethasone suppression test, or 3) late night salivary cortisol
• consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM)
• confirm with one of the remaining tests if necessary (do not rely on random cortisol, insulin tolerance, loperamide, or urinary 17-ketosteroid tests)

Treatment
• adrenal
  ■ adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation post-operatively
  ■ carcinoma: adjunctive chemotherapy often not useful (frequent metastases, poor prognosis)
  ■ medical treatment: mitotane, ketoconazole to reduce cortisol
• pituitary
  ■ trans-sphenoidal resection, with glucocorticoid supplement post-operatively
  ■ ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis)
    ■ surgical resection, if possible; chemotherapy/radiation for primary tumour
    ■ medical treatment with mitotane or ketoconazole to reduce cortisol synthesis. Often required when surgery is delayed, contraindicated, or unsuccessful

Congenital Adrenal Hyperplasia
• see Pediatrics, P29

Hyperandrogenism

Definition
• state of having excessive secretion of androgens (DHEA, DHEA sulfate, testosterone)

Etiology and Pathophysiology

Table 23. Etiology of Hyperandrogenism

Clinical Features
Females
- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism
- virilization
  - masculinization: hirsutism, temporal balding, clitoral enlargement, deepening of voice, acne
  - increase in musculature
- defeminization
  - loss of female secondary sex characteristics (i.e. amenorrhea, ↓ breast size, infertility)

Males
- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production, and spermatogenesis

Investigations
- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose, lipids, 75 g OGTT

Treatment
- discontinue causative medications
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase sex hormone binding globulin, which binds androgens>estrogens; reduce ovarian production of androgens)
- surgical resection of tumour
- low dose glucocorticoid ± mineralocorticoid if CAH suspected
- treat specific causative disorders, e.g. tumours, Cushing’s, etc.
- cosmetic therapy (laser, electrolysis)

Adrenocortical Insufficiency

Definition
- state of inadequate cortisol and/or aldosterone production by the adrenal glands

Etiology

PRIMARY (ADDISON’S DISEASE)

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

Treatment
• acute condition – can be life-threatening
  ▪ IV NS in large volumes (2-3 L); add D5W if hypoglycemic from adrenal insufficiency
  ▪ hydrocortisone 50-100 mg IV q6-8h for 24h, then gradual tapering
  ▪ identify and correct precipitating factors
• maintenance
  ▪ hydrocortisone 15-20 mg total daily dose, in 2-3 divided doses, highest dose in the AM
  ▪ Florinef® (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
  ▪ major stress (e.g. surgery, trauma) requires 150-300 hydrocortisone IV daily divided into 3 doses
  ▪ medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

Adrenal Medulla

Catecholamine Metabolism
• catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
• broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

Pheochromocytoma

Definition
• rare catecholamine secreting tumour derived from chromaffin cells of the sympathetic system

Epidemiology
• most commonly a single tumour of adrenal medulla
• rare cause of HTN (<0.2% of all hypertensives)

Etiology and Pathophysiology
• most cases sporadic (80%)
  ▪ familial: associated with multiple endocrine neoplasia II (MEN IIA and IIB) (50% penetrance; i.e.
  50% of people with the mutation get pheochromocytoma), von Hippel-Lindau (10-20% penetrance),
  paragangioma (20% penetrance), or neurofibromatosis type 1 (0.1-5.7% penetrance)
• tumours, via unknown mechanism, able to synthesize and release excessive catecholamines
Clinical Features
- 50% suffer from paroxysmal HTN; the rest have sustained HTN
- classic triad (not found in most patients): episodic “pounding” headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods)

Investigations
- urine catecholamines
  - increased catecholamine metabolites (metanephrines) and free catecholamines
  - plasma metanephrines if available (most sensitive)
- CT abdomen
  - if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

Treatment
- surgical removal of tumour (curative) with careful pre- and post-operative ICU monitoring
- adequate pre-operative preparation
  - α-blockade for BP control: doxazosin or calcium channel blockers (10-21 d pre-operative), IV phentolamine (perioperative, if required)
  - β-blockade for HR control once a blocked for a few days
- metyrosine (catecholamine synthesis inhibitor) + phenoxybenzamine or prazosin
- volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo post-operatively
- screen urine in first degree relatives; genetic testing in patients <50 yr old

Disorders of Multiple Endocrine Glands

Multiple Endocrine Neoplasm

- neoplastic syndromes involving multiple endocrine glands
- tumours of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance
- genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN II
  - early cure and prevention of medullary thyroid cancer

Table 26. MEN Classification

</tr>
</tbody>
</table>

Investigations
- MEN I
  - laboratory
    - may consider genetic screening for MEN-1 mutation in index patients
      - if a mutation is identified, screen family members who are at risk
    - gastrinoma: elevated serum gastrin level (>280 ng/mL) after IV injection of secretin
    - insulinoma: reduced fasting blood glucose (hypoglycemia) with elevated insulin and C-peptide levels
    - glucagonoma: elevated blood glucose and glucagon levels
    - pituitary tumours: assess GH, IGF-1, and prolactin levels (for over-production), TSH, free T4, 8 AM cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
      - hyperparathyroidism: serum Ca²⁺ and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - MRI for pituitary tumours, gastrinoma, insulinoma
- MEN II
  - laboratory
    - genetic screening for RET mutations in all index patients
      - if a mutation is identified screen family members who are at risk
    - calcitonin levels (MTC); urine catecholamines and metanephrines (pheochromocytoma); serum Ca²⁺, albumin, and PTH levels (hyperparathyroidism)
    - pentagastrin ± calcium stimulation test if calcitonin level is within reference range
    - FNA for thyroid nodules-cytology
  - imaging
    - CT or MRI of adrenal glands, metaiodobenzylguanidine (MIBG) scan for pheochromocytoma
    - octreoscan and/or radionuclide scanning for determining the extent of metastasis

Treatment
- MEN I
  - medical
    - proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
    - cabergoline or other dopamine agonists to suppress prolactin secretion
    - somatostatin for symptomatic carcinoid tumours
  - surgery for hyperparathyroidism, insulinoma, glucagonoma, pituitary tumours (if medical treatment fails for the latter)
    - trans-sphenoidal approach with prn external radiation
- MEN II
  - surgery for MEN IIa with pre-operative medical therapy
    - prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
    - α-blocker for at least 10-21 d for pheochromocytoma pre-operatively
    - hydration, calcitonin, IV bisphosphonates for hypercalcemia

Calcium Homeostasis
- normal total serum Ca²⁺: 2.2-2.6 mmol/L
- ionic/free Ca²⁺ levels: 1.15-1.31 mmol/L
- serum Ca²⁺ is about 40% protein bound (mostly albumin), 50% ionized, and 10% complexed with PO₄³⁻ and citrate
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D
- actions mainly on three organs: GI tract, bone, and kidney
**Hypercalcemia**

**Definition**
- total corrected serum Ca\(^{2+}\) >2.6 mmol/L OR ionized Ca\(^{2+}\) >1.35 mmol/L

**Approach to Hypercalcemia**
1. Is the patient hypercalcemic? (correct for albumin – see sidebar)
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low? If phosphate is high/normal is the level of vitamin D metabolites high or low?
Clinical Features

• symptoms depend on the absolute Ca\(^{2+}\) value and the rate of its rise (may be asymptomatic)

Table 28. Symptoms of Hypercalcemia

</table>

| **Hypercalcemic crisis (usually >4 mmol/L or 16 mg/dL): primary symptoms include oliguria/anuria and mental status changes including somnolence and eventually coma → this is a medical emergency and should be treated immediately!** |

Treatment

• treatment depends on the Ca\(^{2+}\) level and the symptoms
• treat acute, symptomatic hypercalcemia aggressively
• treat the underlying cause of the hypercalcemia
Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis

| Increase Urinary Ca²⁺ Excretion | Isotonic saline (4-5 L) over 24 h ± loop diuretic (e.g. furosemide) but only if hypervolemic (urine output >200mL/h)
Calcitonin:
4 IU/kg IM/SC q12h
8 IU/kg IM/SC q6h
Only works for 48 h
Rapid onset within 4-6 h |
|---|---|
| Diminish Bone Resorption | Bisphosphonates (treatment of choice)
Inhibits osteoclastic bone resorption and promotes renal excretion of calcium
Acts rapidly but often transient response (decreased by 0.3-0.5 mmol/L beginning within 4-6 h) max effect usually in 7 d
Combination of calcitonin and steroids may prolong reduction in calcium
Tachyphylaxis may occur
Indicated in malignancy-related hypercalcemia (IV pamidronate or zoledronic acid used)
Mithramycin (rarely used) – effective when patient cannot tolerate large fluid load
Dangerous – hematotoxic and hepatotoxic |
| Decrease GI Ca²⁺ Absorption | Corticosteroids in hypervitaminosis D and hematologic malignancies
Anti-tumour effects → decreased calcitriol production by the activated mononuclear cells in lung and lymph node
Slow to act (5-10 d); need high dose |
| Dialysis | Treatment of last resort
Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure |

### Hypocalcemia

**Definition**
- total corrected serum Ca²⁺ <2.2 mmol/L

**Table 30. Clinical Features of Hypocalcemia**

<table>
<thead>
<tr>

</tr>
<tr>
<td>Trouseau’s sign (carpal spasm)</td>
<td>OCULAR: cataracts</td>
</tr>
<tr>
<td>ECG changes</td>
<td>MSK: generalized muscle weakness and wasting</td>
</tr>
<tr>
<td>Delirium</td>
<td>Psychiatric Sx: emotional instability, anxiety, and depression</td>
</tr>
</tbody>
</table>

**Approach to Hypocalcemia**
1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the Mg²⁺ level low?

**Approach to Treatment**
- correct underlying disorder
- mild/asymptomatic (ionized Ca²⁺ >0.8 mmol/L)
  - treat by increasing dietary Ca²⁺ by 1000 mg/d
  - calcitriol 0.25 µg/d (especially in renal failure)
- acute/symptomatic hypocalcemia (ionized Ca²⁺ <0.7 mmol/L)
  - immediate treatment required
  - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion if necessary
  - goal is to raise Ca²⁺ to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion
  - if PTH recovery not expected, requires long-term therapy with calcitriol and calcium
  - do not correct hypocalcemia if asymptomatic and suspected to be transient

**Differential Diagnosis of Hypocalcemia**
- Primary hyperparathyroidism
- Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, TB, Hodgkin’s lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

**Acute Management of Hypercalcemia/ Hypercalcemic Crisis**
- Volume expansion (e.g. NS IV 300-500 cc/h); initial therapy
- Calcitriol: transient, partial response
- Bisphosphonate: treatment of choice
- Corticosteroid: most useful in vitamin D toxicity, granulomatous disease, some malignancies
- Saline diuresis → loop diuretic (for volume overload): temporary measure

**Hypomagnesemia can impair PTH secretion and action**

**Differential Diagnosis of Tetany**
- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

**Signs and Symptoms of Acute Hypocalcemia**
- Paresthesias: perioral, hands, and feet
- Chvostek’s sign: percussion of the facial nerve just anterior to the external auditory meatus elicits glistening spasm of the orbicularis oculi or orbicularis oris muscles
- Trouseau’s sign: inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

**Transient hyperparathyroidism (resulting in hypocalcemia) common after subtotal thyroidectomy (permanent in <3% of surgeries)**
Metabolic Bone Disease

Osteoporosis

Definition
- a condition characterized by decreased bone mass and microarchitectural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility to fracture
- bone mineral density (BMD) ≥2.5 standard deviations below the peak bone mass for young adults (i.e. T-score ≤ -2.5)
- osteopenia: BMD with T-score between -1.0 and -2.5

Etiology and Pathophysiology

Primary Osteoporosis (95% of osteoporosis in women and 80% in men)
- primary type 1: most common in post-menopausal women, due to decline in estrogen, worsens with age
- primary type 2: occurs after age 75, seen in females and males at 2.1 ratio, possibly due to zinc deficiency

Secondary Osteoporosis
- gastrointestinal diseases
  - gastrectomy
  - malabsorption (e.g. celiac disease)
  - chronic liver disease
- bone marrow disorders
  - multiple myeloma
  - lymphoma
  - leukemia
- endocrinopathies
  - Cushing’s syndrome
  - hyperparathyroidism
  - hyperthyroidism
  - premature menopause
  - DM
  - hypogonadism
- malignancy
  - secondary to chemotherapy
  - myeloma
- drugs
  - corticosteroid therapy
  - phenytoin
  - chronic heparin therapy
  - androgen deprivation therapy
  - aromatase inhibitors
- other
  - rheumatologic disorders
  - rheumatoid arthritis
  - SLE
  - ankylosing spondylitis
  - renal disease
  - poor nutrition
  - immobilization
  - COPD (due to disease, tobacco, and glucocorticoid use)

Figure 17. Etiology and clinical approach to hypocalcemia

Online Clinical Tools
CAROC
www.osteoporosis.ca/multimedia/pdf/CAROC.pdf
FRAX
www.shef.ac.uk/FRAX/tool.aspx
Clinical Features
- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist
  - fragility fractures: fracture with fall from standing height
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
- x-ray: vertebral compression and crush fractures, wedge fractures, "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

Approach to Osteoporosis
1. assess risk factors for osteoporosis on history and physical
2. decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women ≥65 yr or younger if presence of risk factors
3. Initial investigations
   - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
   - also consider serum and urine protein electrophoresis, celiac workup, and 24 h urinary Ca excretion to rule out additional secondary causes
- 25-OH-Vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level ≥75 nmol/L is achieved
- lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture
4. Assess 10-yr fracture risk by combining BMD result and risk factors (only if ≥50 yr)
   1) WHO Fracture Risk Assessment Tool (FRAX)
   2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
5. For all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 33)

Calcium Plus Vitamin D Supplementation and Risk of Fractures, Osteoporosis

Purpose: To review trials of Vitamin D and Calcium therapy for reducing fracture risk in osteoporosis.

Study: Systematic review searching 2011-2015, inclusive, identified 8 RCTs totaling 30,970 participants. RCTs reviewed included healthy adults and ambulatory older adults with medical conditions (excluding cancer). Vitamin D and Calcium combination therapy was compared to placebo.

Results: Analysis of RCT data revealed that calcium plus vitamin D supplementation produced a statistically significant reduction in risk of total fractures (0.65; CI:0.55-0.79) and in hip fractures (0.70; CI:0.56-0.87). Subgroup analysis was significant for community dwelling or institutionalized patients.

Conclusions: Systematic analysis suggests that Vitamin D and Calcium therapy significantly decreases fracture risk. This study did not specifically look at individuals with osteoporosis. However, it still supports that Vitamin D and Calcium should continue to be used as preventative treatment for individuals at increased risk of fractures.

Clinical Signs of Fractures or Osteoporosis
- Height loss ≥3 cm (Sn 92%)
- Weight <51 kg
- Kyphosis (Sp 92%)
- Tooth count <20 (Sp 92%)
- Grip strength
- Arm-spine-height difference ≥5 cm (Sp 78%)
- V-AI-occiput distance >0 cm (Sp 87%)
- Rib-pelvis distance ≥2 finger breadths (Sn 88%)

- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
- loss of vitamin D binding protein
  - nephrotic syndrome
- defective 1α,25 hydroxylation
  - hypoparathyroidism
- renal failure
- pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

**Mineralization Defect**
- abnormal matrix
  - osteogenesis imperfecta
  - fibrogenesis imperfecta
  - axial osteomalacia
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - bisphosphonates, aluminum, high dose fluoride, anticonvulsants

| Conditions associated with abnormal matrix formation | Normal | Normal | Normal |

- radiologic findings
  - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profunda hip deformity
  - bone biopsy: usually not necessary but considered the gold standard for diagnosis

**Treatment**
- definitive treatment depends on the underlying cause
- vitamin D supplementation
- PO₄³⁻ supplements if low serum PO₄³⁻, Ca²⁺ supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

**Renal Osteodystrophy**

- changes to mineral metabolism and bone structure secondary to chronic kidney disease
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoid
- metastatic calcification secondary to hyperphosphatemia may occur

**Pathophysiology**
- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits 1,25(OH)₂-Vit D synthesis) and loss of renal mass (reduced 1α-hydroxylase)
Clinical Features
- soft tissue calcifications, necrotic skin lesions if vessels involved
- osteodystrophy, generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

Investigations
- serum Ca\(^{2+}\)-corrected for albumin, PO\(_4\), PTH, ALP, ± imaging (x-ray, BMD), ± bone biopsy

Treatment
- prevention
- maintenance of normal serum Ca\(^{2+}\) and PO\(_4\) by restricting PO\(_4\) intake to 1 g OD
- Ca\(^{2+}\) supplements; PO\(_4\) binding agents (calcium carbonate, aluminum hydroxide)
- vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification

Paget’s Disease of Bone

Definition
- a metabolic disease characterized by excessive bone destruction and repair

Epidemiology
- a common disease: 5% of the population, 10% of population >80 yr old
- consider Paget’s disease of bone in older adults with ↑ ALP but normal GGT

Etiology and Pathophysiology
- postulated to be related to a slowly progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

Differential Diagnosis
- primary bone lesions
  - osteogenic sarcoma
  - multiple myeloma
  - fibrous dysplasia
- secondary bone lesions
  - osteitis fibrosa cystica
  - metastases

Clinical Features
- usually asymptomatic (routine x-ray finding or elevated ALP)
- severe bone pain (e.g. pelvis, femur, tibia) is often the presenting complaint
- skeletal deformities: bowed tibia, kyphosis, frequent fractures
- skull involvement: headaches, increased hat size, deafness
- increased warmth over involved bones due to increased vascularity
- high output CHF
- hypercalcemia with immobilization
- osteosarcoma

Investigations
- laboratory
  - ↑↑ serum ALP (unless burnt out), Ca\(^{2+}\) normal or ↑, PO\(_4\) normal
  - urinary hydroxyproline ↑ (indicates resorption)
- imaging
  - bone scan to evaluate the extent of disease
  - confirmation on x-ray required to establish the diagnosis
  - skeletal survey: involved bones are denser and expanded with cortical thickening
    - initial lesion may be destructive and radiolucent
    - multiple fissure fractures in long bones

Complications
- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
    - indicated by marked bone pain, new lytic lesions and suddenly increased ALP
- systemic
  - hypercalcemia and nephrolithiasis
  - high output CHF due to increased vascularity
Male Reproductive Endocrinology

Androgen Regulation

- negative feedback may occur by androgens directly or after conversion to estrogen
- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm)
- LH, FSH, total, bioavailable, and/or free testosterone
- human chorionic gonadotropin (hCG) stimulation test
  - assesses ability of Leydig cell to respond to gonadotropin
  - semen analysis
  - semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

Hypogonadism and Infertility

- see Urology: U34
- deficiency in gametogenesis or testosterone production

Etiology

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic
- primary hypogonadism is more common than secondary

Table 36. Classification and Features of Hypogonadism

Figure 19. Hypothalamo-pituitary-gonadal axis

Two Distinct Features of Primary Hypogonadism

- Associated with an equivalent decrease in sperm count and serum testosterone
- Likely to be associated with gynecomastia

Two Features of Secondary Hypogonadism

- Associated with an equivalent decrease in serum testosterone
- Less likely to be associated with gynecomastia

Testes

- Sertoli cell
- Leydig cell
- Testosterone

- Figure 19. Hypothalamo-pituitary-gonadal axis

- E45 Endocrinology
- Male Reproductive Endocrinology
- Toronto Notes 2017

Treatments

- symptomatic therapy (pain management)
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if ALP >3x normal
  - bisphosphonates, e.g. alendronate 40 mg PO OD x 6 mo or risedronate 30 mg PO OD x 3 mo OR zoledronic acid 5 mg IV per yr
  - calcitomin 50-100 U/d SC
- surgery for fractures, deformity, degenerative changes
Treatment
- Testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - Side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
  - Contraindicated if history of metastatic prostate cancer, breast cancer, severe LUTS associated with BPH, uncontrolled or poorly controlled CHF, PSA>4, hematocrit >50%
- GnRH agonist to restore fertility, if hypotalamic dysfunction with intact pituitary
  - Administered SC in pulsatile fashion using an external pump
- hCG ± recombinant follicular stimulating hormone (rFSH) can be used to restore fertility in cases of either hypotalamic or pituitary lesions
- Testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

Other Causes of Male Infertility
- Hereditary disorders: Kartagener syndrome (primary ciliary dyskinesia), cystic fibrosis
- Anatomy: hypospadias, retrograde ejaculation
- Obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- Sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- Surgery: TURP, radical prostatectomy, orchietomy

DEFECTS IN ANDROGEN ACTION

Etiology
- Complete androgen insensitivity (CAIS)
- Partial androgen insensitivity (PAIS)
- 5-a-reductase deficiency
- Mixed gonadal dysgenesis
- Defects in testosterone synthesis
- Infertile male syndrome
- Undervirilized fertile male syndrome

Clinical Features
- Depends on age of onset

Adapted from: UpToDate, 2010; Cecil’s Essentials of Medicine

Treatment
- Appropriate gender assignment in the newborn
- Hormone replacement or supplementation
- Psychological support
- Gonadectomy for cryptorchidism (due to increased risk for testicular cancer)
- Reduction mammoplasty for gynecomastia

Erectile Dysfunction

- See Urology, U30
Gynecomastia

Definition
• true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
• pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals

Etiology

Physiologic
• puberty
• elderly (involutional)
• neonatal (maternal hormone)

Pathologic
• endocrinopathies: primary or secondary hypogonadism, hyperthyroidism, extreme hyperprolactinemia, adrenal disease
• tumours: pituitary, adrenal, testicular, breast, ectopic production of hCG
• chronic diseases: cirrhosis, renal, malnutrition (with refeeding)
• drugs: estrogens and estrogen agonists, spironolactone, ketoconazole, cimetidine, digoxin, chemotherapy, marijuana, alcohol
• congenital/genetic: Klinefelter's syndrome, androgen insensitivity
• other: idiopathic (majority of gynecomastia is classified as idiopathic), familial

Pathophysiology
• hormonal imbalance due to increased estrogen activity (increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen) or decreased androgen activity (decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage)

History
• recent change in breast characteristics
• trauma to testicles
• mumps
• alcohol and/or drug use
• FHx
• sexual dysfunction

Physical Exam
• signs of feminization
• breast
  • rule out red flags suggesting breast cancer: unilateral, eccentric, hard or fixed mass, skin dimpling or retraction, and nipple discharge or crusting
  • gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue
• genito-urinary exam
• stigmata of liver or thyroid disease

Investigations
• laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated need to locate the primary tumour)
• CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
• testicular U/S to rule out testicular mass
• MRI of hypothalamic-pituitary region if pituitary adenoma suspected

Treatment
• initial observation for most men with gynecomastia
• medical
  • correct the underlying disorder, discontinue responsible drug
  • androgens for hypogonadism
  • anti-estrogens: tamoxifen has most evidence for benefit
  • aromatase inhibitors: less evidence of benefit as compared to anti-estrogens
• surgical
  • usually required for macromastia, gynecomastia present for >1 yr (fibrosis is unresponsive to medication), or failed medical treatment and for cosmetic purposes

Pubertal Gynecomastia
• This benign condition peaks between 13-14 years of age and spontaneously regresses in 90% of cases within 2yr
• Waiting is often the best approach

Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

**Investigations**
- CBC, electrolytes, creatinine, LFTs, ALP, ESR, CRP, serum/urine electrophoresis
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, PET scan
- ± endoscopy

**Treatment**
- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: IVlg, steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

**Drug Class**
- **Biguanide**
- **Insulin Secretagogues**
- **Insulin Sensitizers (thiazolidinedione)**
- **α-Glucosidase Inhibitor**
- **Dipeptidyl Peptidase-IV (DPP-IV) Inhibitor**

**Mechanism of Action**
- Sensitizes peripheral tissues to insulin
- Increases glucose uptake
- Decreases hepatic glucose production
- Sensitizes peripheral tissues to insulin
- Increases glucose uptake
- Decreases FFA release from adipose
- Sensitizes peripheral tissues to insulin
- Increases glucose uptake
- Decreases FFA release from adipose
- Carbohydrate GI absorption by inhibiting brush border α-glucosidase
- Inhibits degradation of endogenous antihyperglycemic incretin hormones
- Incretin hormones stimulate insulin secretion, inhibit glucagon release, and delay gastric emptying

**Generic Drug Name**
- metformin
- repaglinide
- nateglinide
- rosiglitazone
- pioglitazone
- acarbose
- sitagliptin
- saxagliptin
- linagliptin

**Canada Name**
- Glucophage®
- Glumetza®
- Glucobay®
- Januvia®
- Onglyza™
- Trajenta®

**US Name (if different)**
- Glucophage®
- Glumetza®
- Micronase®
- Glynase PreTab®
- Diamicron®
- Glynase PreTab®
- Amaryl®
- Gliclazide®
- Starlix®
- Avandia®
- Actos®
- Glucobay®
- Januvia®
- Onglyza™
- Trajenta®

**Dosing**
- 500 mg OD titrated to 2000 mg/d maximum
- 2.5-5.0 mg/d titrated to > 5 mg bid
- 40-160 mg bid 30-120 mg OD
- 1-8 mg OD
- 0.5-4 mg tid
- 60-120 mg tid
- 2-8 mg OD
- 15-45 mg OD
- 25 mg OD titrated to 100 mg tid
- 100 mg OD
- 2.5-5 mg OD
- 5 mg OD

**Indications**
- Useful in obese type 2 DM
- Improves both fasting and postprandial hyperglycemia
- Also ↓ TG
- AbsOLUTE: GI upset (abdo discomfort, bloating, diarrhea)
- ↓ HbA1c 1.0-1.5%
- Weight neutral

**Contraindications**
- ABSOLUTE: Moderate to severe liver dysfunction
- RELATIVE: Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction
- Avoid glyburide in the elderly
- INTERACTIONS: Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin
- Peripheral edema
- CHF
- Anemia
- Fluid retention and CHF
- Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing)
- Increased risk of bladder cancer with pioglitazone
- Fractures

**Side Effects**
- GI upset (abdo discomfort, bloating, diarrhea)
- Lactic acidosis
- Anorexia
- ↓ HbA1c 1.0-1.5%
- Weight neutral

**Comments**
- ↓ HbA1c 0.8%
- Gliclazide lowest incidence of hypoglycemia
- ↓ HbA1c 0.7% for repaglinide and 0.5-1.0% for nateglinide
- ↓ HbA1c 0.8%

### Primary Care Models

- Antimicrobial Quick Reference

### References
Four Principles of Family Medicine

1. The family physician is a skilled clinician
   - diagnoses and manages diseases common to the population served
   - recognizes importance of early diagnosis of serious life-threatening illnesses

2. Family medicine is a community-based discipline
   - provides information and access to community services
   - responds/adapts to changing needs and circumstances of the community

3. The family physician is a resource to a defined practice population
   - serves as a health resource
   - advocates for public policy to promote health

4. The patient-physician relationship is central to the role of the family physician
   - commits to the person, not just the disease
   - promotes continuity of patient care

Periodic Health Examination

- Canadian Task Force on Preventive Health Care established in 1976, first published in 1979
- mandate: to develop and disseminate clinical practice guidelines for primary and preventive care
- recommendations are based on systematic analysis of scientific evidence
  - most notable recommendation is the abolition of the annual physical exam; replaced by the PHE

Purpose of the Periodic Health Examination

- primary prevention: identify risk factors for common diseases; counsel patients to promote healthy behaviour
- secondary prevention: presymptomatic detection of disease to allow early treatment and to prevent disease progression
- update clinical data
- enhance patient-physician relationship

Classification of Recommendations (GRADE, 2011)

Strength of Recommendation
- strong: high level of confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
  - implies that most individuals will be best served by the recommended course of action
Periodic Health Examination

**Quality of Evidence**
- **weak**: desirable effects probably outweigh the undesirable effects (weak recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (weak recommendation against an intervention); uncertainty exists
- implies that most people would want the recommended course of action but that many would not
- different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

**PHYSICAL**

- Blood pressure measurement, using techniques described in CHEP guidelines (strong recommendation; moderate quality evidence)
- BMI measurement in obese adults (B)
- **Pediatrics**: Repeated examinations of hips, eyes and hearing (especially in first year of life) (A), Serial height, weight and head circumference (B), Visual acuity testing after age 2 (B)
- **Adults >65**: Visual acuity (Snellen sight chart) (B), Hearing impairment (inquiry, whispered voice test, audiocope) (B)
- **First-Degree Relative with Melanoma**: Full body skin exam (B)

**TESTS**

- See recommendations below for age and gender specific screening for diabetes, dyslipidemia, hypertension and cancer screening (colon, prostate, cervical, lung, and breast)
- **Pediatrics**: Routine hemoglobin for high risk infants (B), Blood lead screening of high risk infants (B)
- **TB High Risk Groups**: Mantoux skin testing (A)
- **STI High Risk Groups**: Viral HSV antibody screening (A) Gonorrhea screening (A) Chlamydia screening in women (B) Syphilis screen (A)
- **Syphilis Risk Group**: VDRL test (A)

**THERAPY**

- Folic acid supplementation to women of child-bearing age (A)
- Pharmacologic treatment of HTN (Refer to CHEP Guidelines) (A)
- Varicella vaccine for children age 1-12 and susceptible adolescents/adults (A)
- Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B)
- Tetanus vaccine: routine booster q10y or if 1st series (A)
- Pertussis vaccine: adults <65 should receive one booster given as Tdap—Adacel® or Boostrix® (A)
- Herpes zoster vaccine for adults ≥60
- **Pediatrics**: Routine immunizations (A), Hepatitis B, HPV and Meningococcal immunizations are offered in schools in most Canadian provinces
- **Influenza High Risk Groups**: Outreach strategies for vaccination (A), annual immunization (B), now recommended for all
- **TB High Risk Groups** (INH prophylaxis for household contacts or skin test converters (B) INH prophylaxis for high risk sub-groups (B)
- **Immunocompromised/Age<65/COPD/Asthma/CHF/Anemia/Liver Disease/Renal Failure/DM**: Pneumococcal Vaccine (Pneumovax®) (A)

Classification of recommendation in brackets. See sidebar on FM2 for classification details. See www.canadiantaskforce.ca – for up-to-date guidelines

Reference: Canadian Task Force on Preventive Health Care, 2014

Breast Cancer Screening Guidelines

**2011 Recommendations on Screening for Breast Cancer in Average-Risk Women** (The Canadian Task Force on Preventive Health Care)
- average-risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the BRCA1/BRCA2 genes or previous exposures of the chest wall to radiation
Mammography
- age 40-49: routine screening with mammography not recommended (weak recommendation - moderate quality evidence)
- age 50-74: routine screening q2-3yr (age 50-69: weak recommendation; moderate quality evidence, age 70-74: weak recommendation; low quality evidence)
- age 75+: screen if benefits outweigh harm, must take overall health into account

Magnetic Resonance Imaging
- no routine screening with MRI scans (weak recommendation - low quality evidence)

Clinical Breast Examination
- no routine CBE alone or in conjunction with mammography to screen for breast cancer (weak recommendation - low quality evidence)

Breast Self-Examination
- recommend not advising women to routinely practice breast self-examination
- for more information on benign breast lesions and breast cancer, see General Surgery, GS55

Lung Cancer Screening Guidelines
2016 Canadian Task Force on Preventative Health Care
- apply to adults aged 18 and older who are not suspected of having lung cancer
- annual screening with low dose CT for adults aged 55-74 with at least a 30 pack-year smoking history who currently smoke or quit less than 15 years ago, up to three consecutive times

Colorectal Cancer Screening Guidelines
- recommendations for average risk individuals (asymptomatic, no family history of UC, polyps, or CRC)
- average risk testing should begin at age 50, but assessment for risk factors should begin earlier to identify high-risk individuals
  - Canadian Task Force on Preventative Health Care (2016)
    - FOBT (either high sensitivity FOBT or FIT - fecal immunochemical testing) q2yr OR flexible sigmoidoscopy q10yr
    - no colonoscopy as a screening test
    - no screening after age 75 is recommended for average risk patients, but it may be assessed on an individual basis for ages 76-85
- for more information on colorectal neoplasms, see General Surgery, GS33

![Figure 1. Approach to higher risk screening](http://www.bcguidelines.ca/pdf/colorectal_screening.pdf)

AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great-grandparents or cousins. Figure printed with permission from Can J Gastroenterol 2004:18:3:98.
### Cervical Cancer Screening

- either conventional Papanicolaou (Pap) smear or liquid based cytology testing
- endocervical and exocervical cell sampling (aim is to sample the transitional zone)
- best identifies squamous cell abnormalities, less reliable for glandular abnormalities
  - false positives 5-10%, false negatives 10-40% (for single test)
  - false negative rate 50% for existing cervical cancer
- cervical cancer screening guidelines differ by provincial jurisdiction (see The Society of Obstetricians and Gynaecologists of Canada guidelines)

- Canadian Task Force for Preventative Care Guidelines
  - screen all women age ≥25 q3yr (age 25-29: weak recommendation; moderate quality evidence, age 30-69: strong recommendation; high quality evidence)
  - women age ≥70: if 3 normal tests in a row and no abnormal tests in last 10 yr, can discontinue screening (weak recommendation; low quality evidence)

- Ontario guidelines
  - screen all women age ≥21 who are or have ever been sexually active (includes intercourse or digital/oral activity with partner of either gender)
  - if cytology is normal, can screen every 3 yr
  - women age ≥70: if 3 successive negative Pap tests in last 10 yr, can discontinue screening
  - women who are not sexually active by age 21 should delay cervical cancer screening until sexually active
  - pregnant women and women who have sex with women should follow the routine cervical screening regimen
  - women who have had a hysterectomy
    - total: discontinue screening if hysterectomy was for benign disease and no history of cervical dysplasia or HPV infection, continue to swab vaginal vault if history of uterine malignancy/dysplasia
    - subtotal: continue screening according to guidelines
  - exceptions to guidelines
    - immunocompromised (transplant, steroids, diethylstilbestrol exposure, HIV)
    - previously unscreened patients
  - for more information on cervical cancer (see Gynecology, GY43)

### Prostate Cancer Screening

- Canadian Task Force for Preventative Care Guidelines
  - screening for prostate cancer with the prostate specific antigen test is not recommended for any age group (age <55: strong recommendation; low quality evidence, age 55-69: weak recommendation; moderate quality evidence, age >70: strong recommendation; low quality evidence)

---

**Figure 2. Decision making chart for cervical cancer screening (not applicable for adolescents)**

AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; LSIL = high grade squamous intraepithelial lesion; LSIL = low grade squamous intraepithelial lesion; TZ = transitional zone

Adapted from: Ontario Cervical Screening Cytology Guidelines. May 2012

---

**Prostate Cancer Mortality at 11 Years of Follow-Up**

Study: Updated “ERSPC” study – multicentre randomized trial of screening for prostate cancer using PSA.

Patients: 162,388 men, ages 55-69 from 8 different European countries.

Intervention: PSA-based screening.

Main Outcome: Mortality from prostate cancer.

Results: After median follow up of 11 yr, the ARR of death from prostate cancer was 21%. The ARR was 1.07 deaths/1,000 men. NNT = 1,055 – therefore to prevent one death from prostate cancer at 11 yr follow up, 1,055 men would need to be screened.
Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- there are several effective ways to promote healthy behavioural change, such as discussions appropriate to a patient’s present stage of change
- for more information about motivational interviewing, see www.motivationalinterviewing.org

Motivational Strategies for Behavioural Change

<table>
<thead>
<tr>
<th>Patient’s Stage of Change</th>

Table 3. Recommendations for Vitamin D Use
- Based on CCS research on Vitamin D and the prevention of colorectal, breast and prostate cancer
- In consultation with their healthcare provider, the Society is recommending that:
  - Adults living in Canada should consider Vitamin D supplementation of 1,000 international units (IU) a day during the fall and winter
  - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1,000 IU/d all year round. This includes people who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
  - Babies who are exclusively breast-fed: 400 IU/d
Cardiovascular Disease Prevention

MUFAs = monounsaturated fatty acids; PUFAs = polyunsaturated fatty acids

### Obesity

- see Canadian Task force on Preventive Health Care recommendations (CMAJ February 2015) at: [canadiantaskforce.ca/ca/ctfphc-guidelines/2015-obesity-adults/](canadiantaskforce.ca/ca/ctfphc-guidelines/2015-obesity-adults/)
- body mass index (BMI) = weight (kg)/height (m)² = weight (lbs)/height (in)² x 703; BMI is a poor predictor of obesity
- waist circumference (WC) = flexible tape placed on horizontal plane at iliac crest, normal depends on ethnic background
- increased WC for BMI 25-35 increases the risk of cardiovascular disease and type 2 diabetes

### Table 5. Classification of Weight by BMI, Waist Circumference, and Associated Disease Risks in Adults

<table>
<thead>
<tr>
<th>BMI (kg/m²)</th>
<th>Obesity Class</th>
<th>Men ≤102 cm (40 in) Women ≤88 cm (35 in)</th>

<td>Obesity Class III</td>
<td>Extremely High</td>
<td>Extremely High</td>
</tr>
</tbody>
</table>

### Epidemiology

- 16% (4 million) of people ≥18 yr old are obese, 32% (8 million) are overweight in Canada, according to StatsCan (2007)
- obesity rate in people of Aboriginal origin is 1.6 times higher than the national average
- proportion of children aged 6-11 who are overweight has more than doubled in the last 25 yr; percentage of overweight adolescents has tripled
- overweight and obesity rates in children are directly proportional to screen time (see Exercise, FM10)
- only 10-15% of population consume <30% fat daily
- obese persons generally consume more energy-dense food which tends to be highly processed, micronutrient poor, and high in fats, sugars, or starch

### Adverse Medical Consequences of Obesity

- Type 2 DM
- CAD
- Stroke
- HTN
- Gallbladder disease
- Non-alcoholic steatohepatitis
- Complications of pregnancy

- Dyslipidemia
- Osteoarthritis
- Stroke
- Heart failure
- Certain cancers
- CHF
- Low back pain
- Increased mortality
Screening Recommendations
- the CANRISK or FINRISC scores can be used to assess the risk for type 2 diabetes in overweight and obese patients
- BMI risk assessment should be done every 3-5 yr in people at high risk of developing diabetes within 10 yr

Management

**Behavioural/Lifestyle**
- weight loss of >5% is clinically significant for reducing many cardiovascular risk factors (e.g. elevated blood pressure, glucose and lipids)
- efficacious behavioural interventions are greater than 12 months duration, include diet and/or exercise and/or lifestyle components, and include group and individual sessions
- structured behavioural and lifestyle interventions should be offered or arranged for overweight individuals BMI >25
- strong recommendation for those with increased risk of Type 2 DM
- BMI >35 + risk factors or BMI >40 are candidates for bariatric surgery failing behavioural modification

Pharmacologic
- the task force recommends against pharmacologic intervention to manage patients who are overweight and obese, although some patients may prefer medications and be good candidates for pharmacologic treatment
- high benefit of behavioural modification alone, NNH (number needed to harm) 10 (mostly GI side effects) for pharmacotherapy

**Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children (summary)**
Adapted from: CMAJ 2007;176:S1-S13
Dyslipidemia

- see Endocrinology, E2
- defined as abnormal elevation of plasma cholesterol or triglyceride levels

Assessment
- measure fasting serum TC, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males >40 yr and females >50 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see sidebar)
- screen for secondary causes: hypothyroidism, chronic kidney disease, DM, nephrotic syndrome, liver disease

risk category
- estimate using the model for 10 yr CAD risk developed from the Framingham data (Framingham Risk Score – FRS)
  - FRS calculated based on the following factors: gender, age, HDL-C, total cholesterol, sBP, smoking, DM
  - family history of CVD <55 male relative or <65 in female relative doubles FRS
- to be completed for men age 40-75, and women age 50-75 q3-5yr
- cardiovascular age calculated as patient’s age ± the difference between his or her estimated remaining life expectancy
  - used to increase adherence to therapy and reaffirm positive effect of following therapy
- treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C (not used widely yet)
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apo B >1.2g/L or non-HDL-C >4.3 mmol/L
  - other targets include: TC:HDLC ratio, apo B:Apo AI ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Management

- intensity and type of treatment is guided by “risk category” assigned (see Table 6)

1. health behaviours (can decrease LDL-C by up to 10%)
  - smoking cessation: probably the most important for preventing CAD
  - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
  - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk
  - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patients should start treatment immediately with concurrent health behaviour interventions

2. pharmacologic therapy (can decrease LDL-C by up to 40%)
  - for a comparison of dyslipidemia medications, see Endocrinology, E50
  - 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
    - risks: myopathy and hepatotoxicity
    - if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
    - post-ACS, cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high risk individuals
    - lower evidence for other agents: bile acid sequestrants, nicotinic acid, fibrates, psyllium
  - monitoring
    - ALT, CK, Cr at baseline then 6 wk later for signs of transaminits or myositis; tolerance rise in CK up to 10 times upper limit of normal vs. 2-3 times if symptomatic, or serum creatinine rise of ≤25%
    - no routine repeated measures of ALT and CK necessary in asymptomatic patients using statin therapy
    - if adequate response is achieved, evaluate fasting lipids q6-12mo

To calculate Framingham Risk Score, go to http://www.framinghamheartstudy.org/riskfunctions/cardiovascular-disease/10-year-risk.php#
Isolated Hypertriglyceridemia
- does not increase your cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild ≥2.2 mmol/L (≥200 mg/dL); marked ≥5.6 mmol/L (≥500 mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics,
    increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically >10 mmol/L) is associated with an increased risk of acute
    pancreatitis
- drug therapy (used to prevent pancreatitis, NOT cardiovascular disease!)
  - nicotinic acid
  - fibrates

Exercise

Epidemiology
- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary

Management
- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid
  injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 DM,
    osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, and mental health (morale and self-esteem)

Table 7. Canadian Physical Activity and Sedentary Behaviour Guidelines (2012 CSEP Guidelines)

<table>
<thead>
<tr>
<th>Age Category</th>
<th>Physical Activity Guidelines</th>
<th>Example Activities</th>
<th>Sedentary Behaviour Guidelines</th>
</tr>
</thead>

Statin-Related Adverse Events: A Meta-Analysis
- Clin Ther 2008;20:26-35
- Study: Meta-analysis of 18 RCTs (N = 71,108) focused on adverse effects of statins
- Patients: Those taking statin monotherapy for primary or secondary prevention of CVD
- Main Outcome: Adverse events (AE) including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis).
- Results: Statin therapy increased the risk of any AE by 39% (OR 1.39, 95% CI 1.09-1.79, p=0.004) compared with placebo. Treating 1,000 patients with a statin would cause 9 AE. Serious events (CK >10 times the upper limit of normal or rhabdomyolysis) are infrequent (NNH 1,400) and rhabdomyolysis, although serious, is rare (NNH 7,428).
- Conclusion: Statin therapy was associated with greater odds of AEs compared with placebo but with substantial clinical benefit. Similar rates of serious AEs were observed between statin and placebo.
Smoking Cessation

Epidemiology
• smoking is the single most preventable cause of premature illness and death
• 70% of smokers see a physician each year
• 2012 Canadian data from the Canadian Tobacco Use Monitoring Survey (CTUMS) on population age ≥15
  ▪ 16% are current smokers (lowest since 1965)
  ▪ highest prevalence in age group 20-24 (20%)
  ▪ 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing

Management
• general approach
  ▪ identify tobacco users; elicit smoking habits, previous quit attempts and results
  ▪ CAN-ADAPTT 2012 guidelines
    • tobacco use status should be updated for all patients regularly (Grade 1A)
    • health care providers should clearly advise patients to quit (Grade 1C)
    • health care providers should also monitor the patient’s mental health status/other addictions while quitting smoking. Medication dosage should be monitored and adjusted as necessary (Grade 1A)
  ▪ every smoker should be offered treatment
    • combining counselling and smoking cessation medication is more effective than either alone (Grade 1A)
    • make patient aware of withdrawal symptoms
      • low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
    • ≥4 counselling sessions >10 min each with 6-12 mo follow-up yields better results
    • 14% abstinent with counselling vs. 10% without counselling
    • approach depends on patient’s stage of change (see Motivational Strategies for Behavioural Change, FM6)
• willing to quit
  ▪ provision of social support, community resources (self-help, group, helpline, web-based strategies)
  ▪ pregnant patients: counselling is recommended as 1st line treatment (Grade 1A). Nicotine replacement therapy (NRT) should be made available to pregnant women who are unable to quit using non-pharmacologic methods; intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch (Grade 1C). Use bupropion (no evidence of fetal or reproductive harm) only if benefits > risks; consult Motherisk. Varenicline has not been studied in pregnancy and should not be used in pregnant women
• pharmacologic therapy
  1. Nicotine Replacement Therapy
    • 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
    • no difference in achieving abstinence for different forms of NRT
    • reduces cravings and withdrawal symptoms without other harmful substances that are contained in cigarettes
    • use with caution: immediately post-MI, serious/worsening angina, serious arrhythmia
    • advise NO smoking while using NRT
  2. Antidepressants (note: mode of action appears to be independent of antidepressant effect)
    • Bupropion SR (Zyban®)
      • 21% abstinent at 12 mo vs. 8% for placebo
      • no advantage for NRT vs. bupropion (similarly effective)
    3. Varenicline (Champix®)
      • partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
      • more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% for bupropion vs. 9% with placebo)
      • significant side effects may lower patient compliance

Table 8. Types of Nicotine Replacement Therapy

Physician Advice for Smoking Cessation
Cochrane DB Syst Rev 2013;5:CD0000185
This systematic review of 17 trials compared brief advice by the physician versus no advice.
Conclusions: Simple advice can increase cessation rates by 1%. More intensive advice and providing follow-up support may further increase the quit rates.

The 5 A’s for Patients Willing to Quit
Ask if the patient smokes
 Advise patients to quit
 Assess willingness to quit
 Assist in quit attempt
 Arrange follow-up

The 2-3 Pattern of Smoking Cessation
- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

Assist Patient in Developing Quit Plan
STAR
Set quit date
Tell family and friends (for support)
Anticipate challenges (e.g. withdrawal)
Remove tobacco-related products (e.g. ashtrays/lighters)

Antidepressants for Smoking Cessation
Cochrane DB Syst Rev 2014;1:CD0000031
This systematic review of 90 randomized trials compared antidepressant medication to placebo or alternative pharmacotherapy for smoking cessation and where follow-up was longer than 6 mo.
Conclusions: The antidepressants bupropion and nortriptyline can aid smoking cessation and have a similar efficacy to NRT. Bupropion is less effective than varenicline. Neither SSRIs (e.g. fluoxetine) nor MAOIs aid smoking cessation.

Nicotine Replacement Therapy for Smoking Cessation
Cochrane DB Syst Rev 2012;11:CD0000146
This systematic review of 132 randomized trials compared NRT to placebo or no treatment or compared different NRT doses.
Conclusions: All commercially available forms of NRT (gum, transdermal patch, nasal spray, inhaler, and sublingual tablets/lozenges) are effective as part of a strategy to promote smoking cessation. They increase the rate of quitting by 50-70% regardless of setting and independent on the level of additional support provided to the smoker. Compared to a single form of NRT, combining a nicotine patch with a rapid delivery form of NRT may be more effective.
### Table 9. Pharmacologic Treatments for Smoking Cessation

<table>
<thead>
<tr>
<th>Drug</th>
<th>Mechanism</th>
<th>Dosage</th>
<th>Prescribing*</th>
<th>Contraindications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bupropion</td>
<td>Inhibits re-uptake of dopamine and/or norepinephrine, competitive antagonist</td>
<td>1. 150 mg qAM x 3 d 2. Then 150 mg bid x 7-12 wk 3. For maintenance consider 150 mg bid for up to 6 mo</td>
<td>1. Decide on a quit date 2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk)</td>
<td>Seizure disorder  Eating disorder  MAOI use in past 14 d  Simultaneous use of bupropion (Wellbutrin®) for depression</td>
</tr>
<tr>
<td>Varenicline</td>
<td>Partial nicotinic receptor agonist, and partial nicotinic receptor antagonist</td>
<td>1. 0.5 mg qAM x 3 d 2. Then 0.5 mg bid x 4 d 3. Continue 1 mg bid x 12 wk ± additional 12 wk as maintenance</td>
<td>1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop</td>
<td>Caution with pre-existing psychiatric condition</td>
</tr>
</tbody>
</table>

*Bupropion and Varenicline may be used in combination with nicotine replacement therapy

- unwilling to quit
  - motivational intervention (5 Rs)
    1. Relevance to patient
      - relevant to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
    2. Risks of smoking
      - short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
      - long-term: MI, stroke, COPD, lung CA, other cancers
      - environmental: higher risk in spouse/children for lung CA, SIDS, asthma, respiratory infections
    3. Rewards: benefits
      - improved health, save money, food tastes better, good example to children
    4. Roadblocks: obstacles
      - fear of withdrawal, weight gain, failure, lack of support
    5. Repetition
      - reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)

- recent quitter
  - highest relapse rate within 3 mo of quitting
  - minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
  - prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

### Alcohol

- see Psychiatry, PS23

#### Definition
- diagnostic categories occur along a continuum

#### Epidemiology
- 10-15% of patients in family practice are problem drinkers
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women or elderly, patients with high socioeconomic status

#### Assessment
- screen for alcohol dependence with CAGE questionnaire
  - if CAGE positive, explore with further questions for alcohol abuse/dependence
  - assess drinking profile
    - setting, time, place, occasion, with whom
    - impact on: family, work, social
    - quantity-frequency history
      - how many drinks per day?
      - how many days per week?
      - maximum number of drinks on any one day in the past month

**Standard Drink Equivalents**
- One standard drink = 14 g of pure alcohol
  - Beer (5% alcohol) = 12 oz
  - Wine (12-17% alcohol) = 5 oz
  - Fortified wine = 3 oz
  - Hard liquor (40%) = 1.5 oz

**CAGE Questionnaire**
- Have you ever felt the need to CUT down on your drinking?
- Have you ever felt ANNOYED at criticism of your drinking?
- Have you ever felt GUILTY about your drinking?
- Have you ever had a drink first thing in the morning to steady your nerves or get rid of a hangover? (EYE OPENER)
- A cut-off of 2 for men or 1 for women suggests possibility of problem drinking (sensitivity 85%, specificity 89%)
• if identified positive for alcohol problem
  ■ screen for other drug use
  ■ identify medical/psychiatric complications
  ■ ask about drinking and driving
  ■ ask about past recovery attempts and current readiness for change

Investigations
• GGT and MCV for baseline and follow-up monitoring
• AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
• CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

Management
• intervention should be consistent with patient's motivation for change
• individualized counselling and regular follow-up is crucial
• 10% of patients in alcohol withdrawal will have seizures or delirium tremens
• Alcoholics Anonymous/12-step program
  ■ outpatient/day programs for those with chronic, resistant problems
  ■ family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
• in-patient program if
  ■ dangerous or highly unstable home environment
  ■ severe medical/psychiatric problem
  ■ addiction to drug that may require in-patient detoxification
  ■ refractory to other treatment programs
• pharmacologic
  ■ diazepam for withdrawal
  ■ disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  ■ naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
  ■ may trigger withdrawal in opioid-dependent patients
  ■ acamprosate: glutamate receptor modulator that also reduces craving
• see Psychiatry, PS23

Prognosis
• relapse is common and should not be viewed as failure
• monitor regularly for signs of relapse
• 25-30% of abusers exhibit spontaneous improvement over 1 yr
• 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

Common Presenting Problems

Abdominal Pain

• see Gastroenterology, G11 and General Surgery, GS4

Epidemiology
• 20% of individuals have experienced abdominal pain within the last 6-12 mo
• 90% resolve in 2-3 wk
• only 10% are referred to specialists, of those <10% admitted to hospital

Etiology
• most common diagnosis in family medicine at 28% is "nonspecific abdominal pain," which has no identifiable cause and is usually self-limited
• GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
• urinary tract disorders (e.g. UTI, renal calculi)
• gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
• cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
• other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

Some Adverse Medical Consequences of Problem Drinking
• GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral esophageal cancer
• Cardiac: HTN, alcoholic cardiomyopathy
• Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
• Hematologic: anemia, coagulopathies
• Other: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

Abstinence

Low Risk Drinking
<2 drinks/d
<10 drinks/wk for women
<15 drinks/wk for men

At Risk Drinking
Consumption above low-risk level but no alcohol-related physical or social problems

Alcohol Use Disorder
Physical or social problems
Continued use despite consequences
Inability to fulfill life roles
Legal problems
No evidence of dependence

Alcohol Use Disorder

Figure 5. Continuum of alcohol use

If pain precedes nausea/vomiting, cause of abdominal pain is more likely to be surgical
Pathophysiology
- Type of pain
  - Somatic pain: sharp, localized pain
  - Visceral pain: dull, generalized pain
- Location of pain
  - Epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
  - RUQ: biliary, hepatic, colonic, pulmonary, renal
  - LIQ: cardiac, gastric, pancreatic, renal, vascular
  - Periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon
  - Hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region
  - RLQ: colonic, appendix, gynecologic, renal
  - LLQ: colonic, gynecologic, renal
  - Any location: aneurysm, dissection, ischemia, zoster, muscle strain, hernia, bowel obstruction, ischemia, peritonitis, porphyria, DKA

Investigations
- Guided by findings on history and physical
- Possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, tox screen, β-hCG
- Imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - Abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - Ultrasound (renal stones, gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT scan (AAA, appendicitis), non-contrast helical CT-Scan (first choice for renal stones)
- Other tests
  - Urinalysis
  - Endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - H. pylori testing (urea breath test, serology, biopsy)

Allergic Rhinitis
- See Otolaryngology, OT23

Definition
- Inflammation of the nasal mucosa that is triggered by an allergic reaction
- Classification
  - Seasonal
    - Symptoms during a specific time of the year
    - Common allergens: trees, grass and weed pollens, airborne moulds
  - Perennial
    - Symptoms throughout the year with variation in severity
    - Common allergens: dust mites, animal dander, moulds
- Persistent allergic rhinitis may lead to chronic rhinosinusitis

Etiology
- Increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

Epidemiology
- Affects approximately 40% of children and 20-30% of adults
- Prevalence has increased in developed countries, particularly in the past two decades
- Associated with asthma, eczema, sinusitis, and otitis media

Assessment
- Identify allergens
- Take an environmental/occupational history
- Ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

Management
- Conservative
  - Minimize exposure to allergens
  - Most important aspect of management, often sufficient (may take months)
  - Maintain hygiene, saline nasal rinses
- Pharmacologic agents
  - Oral antihistamines → first line therapy for mild symptoms
    - E.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  - Intranasal corticosteroids for moderate/severe or persistent symptoms (>1 mo of consistent use to see results)
  - Intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)
- allergy skin testing
  - for patients with chronic rhinitis
  - symptoms not controlled by allergen avoidance, pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

**Amenorrhea**

- see Gynecology, GY10

**Anxiety**

- see Psychiatry, PS13

**Epidemiology**

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

**Screening**

- screening tools such as the GAD-7 tool
- screening questions
  - Do you tend to be an anxious or nervous person?
  - Have you felt unusually worried about things recently?
  - Has this worrying affected your life? How?

**Assessment**

- associated symptoms
- risk factors
  - family history of anxiety or depression, past history of anxiety, stressful life event, social isolation, female, comorbid psychiatric diagnosis (e.g. depression)
  - assess substance abuse, comorbid depression, stressful life events, trauma, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms (panic attacks, specific situations/stressors, excessive worry about common concerns, repetitive thoughts and/or behaviours to neutralize the anxiety) and their duration
- Generalized Anxiety Disorder 7-item (GAD – 7) scale to assess level of anxiety

**Symptoms of GAD**

- ANXIOUS, NERVOUS, OR WORRIED
- NO CONTROL OVER THE WORRY
- DURATION > 6 MONTHS
- INABILITY
- CONCENTRATION IMPAIRMENT
- RESTLESSNESS
- ENERGY DECREASED
- SLEEP IMPAIRMENT

**Differential Diagnosis of Anxiety Disorders**

- Panic disorder
- GAD
- Social Anxiety Disorder (previously Social Phobia)
- Agoraphobia
- Specific phobia
- Selective Mutism
- Separation Anxiety Disorder
- Other: GMC, AMC, mood disorder, psychotic disorder, OCD, PTSD

**Rule Out**

- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (COPD)
- Drugs (amphetamine, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

---

**Figure 6. Differentiating anxiety disorders**
Management
• patient education: emphasize prevalence, good recovery rate of anxiety conditions
• lifestyle advice: decrease caffeine and alcohol intake, exercise, relaxation techniques, mindfulness strategies
• self-help materials, community resources (e.g. support groups)
• CBT: cognitive interventions, exposure therapy, etc.
• treat any underlying medical and/or comorbid conditions
• provide support to family and caregivers
• for pharmacotherapy, see Psychiatry, PS48

Asthma/COPD

Definition
• asthma
  ▪ chronic, reversible airway inflammation characterized by periodic attacks of wheezing, SOB, chest tightness, and coughing
  ▪ airways hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucus plugs and increased inflammation
  ▪ cannot be diagnosed at first presentation; called reactive airway disease until recurrent presentations
  ▪ pulmonary function tests (PFTs) can be done from age 6 or when child able to follow instructions to do PFTs
  ▪ peak flow meters are useful in the office and at home for monitoring
• chronic obstructive pulmonary disease (COPD)
  ▪ group of chronic, progressive, non-reversible lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  ▪ emphysema and chronic bronchitis are the most common forms

Table 10. Differentiating COPD from Asthma

</table>

Management
• Mild
  • Step 1: SABA prn (salbutamol)
  • Step 2: SABA prn + LAAC (i.e. tiotropium) or LABA (e.g. salmeterol)
• Moderate
  • Step 3: SABA prn + LAAC + low-dose combined ICS/LABA; consider inhaled vs. oral steroids
• Severe
  • Step 4: ± theophylline

Pneumococcal vaccination, annual influenza immunization

Ongoing patient education, and environmental control SABA taken prn as rescue medication + maintenance meds

Maintenance medications

Step 1: Low-dose ICS

Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LT modifier, or long-acting theophylline

Step 3: Medium/high-dose ICS plus either LABA, LT modifier, or long-acting theophylline

As above plus immunotherapy ± oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization

ICS = inhaled corticosteroids; LAAC = long-acting anticholinergic; LABA = long-acting β-agonist; LT modifier = leukotriene modifier; SABA = short-acting β-agonist

---

**More About Inhalers**
• Aerosols (puffers=MDI,MDI + spacer) MDIs should be used with spacers to:
  • Reduce side effects
  • Improve amount inhaled
  • Increase efficiency of use
• Dry Powder Inhalers (discus, turbuhaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
• Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

**Differential Diagnosis of Wheezing**
• Allergies, anaphylaxis
• Asthma, reactive airway disease
• GERD
• Infections (bronchitis, pneumonia)
• Obstructive Sleep Apnea
• COPD
• Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of hypokalemia: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, NV, polyuria
Benign Prostatic Hyperplasia

- see Urology, U7

Definition
- hyperplasia of the stroma and epithelium in the periurethral transition zone

History and Physical
- include current/past health, surgeries, trauma, current and OTC meds
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

Investigations
- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue
  - values
    - <4.0 ng/mL: normal, but must take into account patient's age and velocity of PSA increase
    - 4-10 ng/mL: consider measuring free/total PSA
    - >10 ng/mL: high likelihood of prostate pathology
- PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
- increased PSA in a younger man is more often due to cancer than other causes
- abnormal DRE or PSA should trigger further assessment
- discuss test with men at increased risk of prostate cancer (FHx, African ancestry) or who are concerned about development of prostate cancer
- decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
- other tests
  - Cr, BUN
  - post-void residual volume by ultrasound
  - urodynamic studies, renal ultrasound
  - patient voiding diary
- tests NOT recommended as part of routine initial evaluation include:
  - cystoscopy
  - cytology
  - prostate ultrasound or biopsy
  - IVP
  - urodynamic studies

Management
- referral to urologist if moderate/severe symptoms
  - conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
    - fluid restriction (avoid alcohol and caffeine)
    - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
    - pelvic floor/Kegel exercises
    - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
  - α-receptor antagonists (e.g. terazosin [Hytrin®], doxazosin [Cardura®], tamsulosin [Flomax®], alfuzosin [Xatral®])
  - relaxation of smooth muscle around the prostate and bladder neck
  - 5-α reductase inhibitor (e.g. finasteride [Proscar®])
  - only for patients with demonstrated prostatic enlargement due to BPH
  - inhibits enzyme responsible for conversion of testosterone into dihydrotestosterone (DHT) thus reducing growth of prostate
  - phytotherapy (e.g. saw palmetto berry extract, Pygeum africanum)
- more studies required before this can be recommended as standard therapy
  - considered safe
• surgical
  ■ TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostates <30 g)
  ■ absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  ■ complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

### Bronchitis (Acute)

**Definition**
- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

**Epidemiology**
- 5th most common diagnosis in family medicine, most common is URTI

**Etiology**
- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, respiratory syncytial virus (RSV)
- 20% bacterial: *M. pneumoniae, C. pneumoniae, S. pneumoniae*

**Investigations**
- sputum culture/gram stain is not useful
- CXR if suspect pneumonia (cough > 3 wk, abnormal vital signs, localized chest findings) or CHF
- PFT with methacholine challenge if suspect asthma

**Management**
- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (see [Antimicrobial Quick Reference, FM49](#))
  - antibiotics in children show no benefit

### Chest Pain

- see [Cardiology and Cardiac Surgery, C4 and Emergency Medicine, ER21](#)

</tbody>
</table>

**Investigations**
- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests [LFTs], etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

**Management of Common Causes of Chest Pain**
- angina/ischemic heart disease
  - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ED
  - myocardial infarction
    - ASA (160-325 mg, chewed stat), clopidogrel (Plavix*), LMWH (enoxaparin), morphine, oxygen, NTG
    - ± reperfusion therapy with fibrinolitics (e.g. tPA, RPA, TNK, or SK) if within 12h (ideally <30 min) or percutaneous intervention (cath lab) if <90 min
    - start β-blocker (e.g. metoprolol starting dose 25 mg PO q6h or bid, titrating to HR goal of 55-60 bpm)
  - endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
  - GERD: antacids, H₂-blockers, PPIs, patient education
  - costochondritis: NSAIDs

**Treatment of Stable Ischemic Heart Disease**
- see [Cardiology and Cardiac Surgery, C27](#)

**Risk Factors for CAD**
- Major
  - Smoking
  - Diabetes
  - HTN
  - Hyperlipidemia
  - Family history of early CAD in first degree relative (males <55 yr, females <65 yr)
  - Untreated obstructive sleep apnea
  - Chronic kidney disease
- Minor
  - Obesity
  - Sedentary lifestyle
  - Age
**Common Cold (Acute Rhinitis)**

- **Definition**
  - viral URTI with inflammation

- **Epidemiology**
  - most common diagnosis in family medicine, peaks in winter months
  - incidence: adults = 2-4/yr, children = 6-10/yr
  - organisms
    - mainly rhinoviruses (30-35% of all colds)
    - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
  - incubation: 1-5 d
  - transmission: person-person contact via secretions on skin/objects and by aerosol droplets

- **Risk Factors**
  - psychological stress, excessive fatigue, allergic nasal/oropharyngeal disorders, smoking, sick contacts

- **Clinical Features**
  - symptoms
    - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
    - general: malaise, headache, myalgias, mild fever
  - signs
    - erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - complications
    - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
    - asthma/COPD exacerbation

- **Differential Diagnosis**
  - allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

- **Management**
  - patient education
    - symptoms peak at 1-3 d and usually subside within 1 wk
    - cough may persist for days to weeks after other symptoms disappear
    - no antibiotics indicated because of viral etiology
    - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
  - prevention
    - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
    - yearly influenza vaccination
  - symptomatic relief
    - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
    - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye’s syndrome)
    - cough suppression: dextromethorphan or codeine if necessary (children under 6 yr of age should not use any cough/cold medications)
    - decongestants, antihistamines
  - patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

**Concussion/Mild Traumatic Brain Injury**

- **Definition**
  - a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 3rd edition (SCAT3), Br J Sports Med 2013 47: 259

**Contraception**

- **Definition**
  - see Gynecology, FY16

- **Emergency Contraception**
  - hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital copper IUD insertion
  - hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
  - copper IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
  - pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
  - advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
  - pharmacists across Canada can dispense Plan B® OTC
Cough

History and Physical
- duration (chronic - 8 wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI, β-blockers), allergies
- PMH: lung (asthma, COPD, CF), heart (CHF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O₂ saturation, respiratory exam, HEENT and precordial exam

Investigations
- guided by findings on history and physical
  - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)
Assessment
- risk factors: see Psychiatry, PS10
- personal or family history of depression
- medications and potential substance abuse problems
- high risk for suicide/homicide
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
  - functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood ≥2 wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck's depression inventory, Zung's self-rating depression scale, Children's depression inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B12, electrolytes, urinalysis, glucose, etc.)

Treatment
- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment options are pharmacotherapy psychotherapy, or a combination of both
- combination therapy is synergistic and most effective
- treatment of youth (age 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
    - monitor closely for adverse effects such as suicidal ideation and behaviour
    - psychotherapy
    - CBT or interpersonal therapy (IPT) alone can be used for mild depression
    - psychotherapy plus medication is recommended for moderate to severe depression
    - treatment should continue for at least 6 months
    - ongoing management should include assessment in key domains (school, home, social setting)
    - reassessment and referral recommended if no improvement after 6-8 wk of treatment
  - for adolescents with moderate/severe depression and coexisting psychosis and/or substance abuse, consider referral

Table 13. Common Medications

<table>
<thead>
<tr>
<th>Class</th>

<td>Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs</td>
<td>Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication</td>
</tr>
<tr>
<td>TCA</td>
<td>amitriptyline (Elavil®)</td>
<td></td>
<td>Sexual dysfunction, weight gain, tremors, tachycardia, sweating</td>
<td>Narrow therapeutic window, lethal in overdose</td>
</tr>
</tbody>
</table>

Prognosis
- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

Diabetes Mellitus
- see Endocrinology, E7

Definition
- metabolic disorder characterized by the presence of hyperglycemia due to deficiency insulin secretion, defective insulin action or both
Classification
- type 1: primarily a result of pancreatic β-cell destruction
- type 2: characterized by insulin resistance
- GDM: glucose intolerance with onset or first recognition during pregnancy

Epidemiology
- major health concern, affecting up to 10% of Canadians
- incidence of type 2 DM is rising due to increasing obesity, sedentary lifestyle, and age of the population
- leading cause of new-onset blindness and renal dysfunction
- Canadian adults with DM are twice as likely to die prematurely, compared to persons without DM

Risk Factors
- type 1 DM
  - personal or family history of autoimmune disease
- type 2 DM
  - first degree relative with DM
  - age ≥40 yr
  - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  - prior GDM, macrosomic baby (≥4 kg)
  - PCOS
  - history of IGT or IFG
  - presence of complications associated with DM
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
  - both
    - member of a high risk population (e.g. Aboriginal, Hispanic, Asian, or African descent)

Diagnosis
- persistent hyperglycemia is the hallmark of all forms of DM

Table 14. Diagnosis of Prediabetes and Diabetes

<table>
<thead>
<tr>
<th>Condition</th>
<th>Diagnostic Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM</td>
<td>One of the following on 2 occasions:</td>
</tr>
<tr>
<td></td>
<td>Random BG ≥11.1 mmol/L (200 mg/dL) with symptoms of DM (fatigue, polyuria,</td>
</tr>
<tr>
<td></td>
<td>polydipsia, unexplained weight loss) OR</td>
</tr>
<tr>
<td></td>
<td>Fasting BG ≥7.0 mmol/L (126 mg/dL) OR</td>
</tr>
<tr>
<td></td>
<td>**If asymptomatic (and meet any of the above criteria) a repeat test must be done to</td>
</tr>
<tr>
<td></td>
<td>confirm the diagnosis. If symptomatic (fatigue, polyuria, polydipsia, unexplained</td>
</tr>
<tr>
<td></td>
<td>weight loss), the diagnosis is made with one test.</td>
</tr>
<tr>
<td>Impaired Fasting Glucose</td>
<td>Fasting BG = 6.1-6.9 mmol/L (110-124 mg/dL)</td>
</tr>
<tr>
<td>(IFG)</td>
<td></td>
</tr>
<tr>
<td>Impaired Glucose Tolerance</td>
<td>BG 2 h post 75 g OGTT ≥7.8-11.0 mmol/L (141-198 mg/dL)</td>
</tr>
<tr>
<td>(IGT)</td>
<td></td>
</tr>
<tr>
<td>Prediabetes</td>
<td>HbA1C = 6.0-6.4%</td>
</tr>
</tbody>
</table>

Screening
- type 2 DM
  - FBG in everyone ≥40 q3yr, or at high risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of ≥1 risk factor (see above)
  - GDM (see Obstetrics, OB26)
    - all pregnant women between 24-28 wk gestation

Goals of Therapy

Table 15. Goals of Therapy in Diabetes

| General                      | Avoid complications (e.g. ketoacidosis, hyperglycemia, infection)                  |
|                             | Prevent long-term complications (microvascular and macrovascular)              |
|                             | Minimize negative sequelae associated with therapies (e.g. hypoglycemia, weight gain) |

| Fasting or Preprandial BG   | Ideal: 4.7 mmol/L (72-126 mg/dL)                                                |
|                             | Suboptimal: 7.1-10 mmol/L (128-180 mg/dL); action may be required                |
|                             | Inadequate: >10.0 mmol/L (180 mg/dL); action required                            |
| HbA1c                       | ≤7% or ≤6.5% in some type 2 DM patients at risk for nephropathy                   |
| Suboptimal: 7.8-4%          | Inadequate: >8.4%                                                               |
| Frail elderly: target is 5-12 mmol/L |                                      |

| 2 h Postprandial BG         | 5-10 mmol/L (90-180 mg/dL) if HbA1c target met                                 |
|                           | 5-8 mmol/L (90-144 mg/dL) if HbA1c target not met                             |
| Frail elderly: use clinical judgment |                                      |

Blood Pressure
- <130/80 in adults (DM and HTN guidelines)

Lipids
- LDL < 2.0 mmol/L (36 mg/dL)

Nonpharmacologic Management

- **diet**
  - all diabetics should see a registered dietician for nutrition counselling
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic-index foods, ensure regularity in timing and spacing of meals
- physical activity and exercise
  - at least 150 min of aerobic exercise per wk, plus 2 sessions per wk of resistance exercise is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if insulin treated, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

Self-Monitoring of Blood Glucose

- **type 1 DM:** 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- **type 2 DM:** recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2013 Canadian Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia
Common Presenting Problems

FM24  Family Medicine

Family Medicine
Toronto Notes 2017

Figure 8. Types of insulin preparation

Figure 9. Management of hyperglycemia in type 2 diabetes

At diagnosis of Type 2 DM
Start lifestyle intervention (nutrition therapy and physical activity) ± Metformin

<table>
<thead>
<tr>
<th>A1C &lt; 8.5%</th>
<th>A1C ≥ 8.5%</th>
<th>Symptomatic hyperglycemia with metabolic decompensation</th>
</tr>

</tbody>
</table>

Add another agent best suited to the individual by prioritizing patient characteristics:

**PATIENT CHARACTERISTIC**

- Degree of hyperglycemia
- Risk of hypoglycemia
- Overweight or obesity
- Cardiovascular disease
- Comorbidities (renal, CHF, hepatic)
- Preferences and access to treatment

**CHOICE OF AGENT**

- SGLT2 inhibitor with demonstrated CV outcome benefit
- Consider relative A1C lowering
- Rare hypoglycemia
- Weight loss or weight neutral
- Effect on cardiovascular outcome
- See therapeutic considerations, consider eGFR
- See cost column; consider access

Add another class of agent best suited to the individual (classes listed in alphabetical order):

<table>
<thead>

</table>

**Note:** Physicians should refer to the most recent edition of the *Compendium of Pharmaceuticals and Specialties* (Pharmacists’ and Specialists’ Evaluation Pharmacists’ Association, Ottawa, Ontario, Canada) for product monographs and for detailed prescribing information.

A1C = glycated hemoglobin  emp = empagliflozin  lixiv = lixisenatide
alo = alogluptin  GI = gastrointestinal  saxa = saxagliptin
CHF = congestive heart failure  sita = sitagliptin
DPP-4 = dipeptidyl peptidase 4  GLP-1 = glucagon-like peptide 1  TZD = thiazolidinediones

If not at glycemic targets

Add another agent from a different class; add or intensify insulin regimen

Make timely adjustments to attain target A1C within 3-6 mo

Figure 8. Types of insulin preparation

Figure 9. Management of hyperglycemia in type 2 diabetes

Hypoglycemic Agents (Type 2 DM)
- oral
  ■ biguanide: metformin (Glucophage®)
  ■ thiazolidinediones: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  ■ α-glucosidase inhibitor: acarbose (Precose®)
  ■ nonsulfonylureas: nateglinide (Starlix®), repaglinide (Glucotrol®)
  ■ sulfonylureas: glyburide (Diabeta®), glimepiride (Amaryl®), gliclazide (Diamicron®)
  ■ DPP-4 inhibitor: sitagliptin (Januvia®)
- injectable
  ■ GLP-1 analogue: liraglutide (Victoza®)

Other Medications Used in DM
- ACEI or ARB in those with any of
  ■ clinical macrovascular disease
  ■ age ≥55 years
  ■ age <55 and microvascular complications
- statin in those with any of
  ■ clinical macrovascular disease
  ■ age ≥40 years
  ■ age <40 and any of the following:
    ■ diabetes duration >15 years and age >30 years
    ■ microvascular complications
    ■ other cardiovascular risk factors
- low dose ASA (81-325 mg)
  ■ for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

Dizziness
- see Otolaryngology OT6

Epidemiology
- 70% see general practitioners initially; 4% referred to specialists
- frequency proportional to age; commonest complaint of ambulatory patients age >75

Differential Diagnosis

Figure 10. Differential diagnosis of dizziness

History
- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration
- exacerbations
  ■ worse with head movement or eye closure (vestibular)
  ■ no change with head movement and eye closure (nonvestibular)
  ■ worse with exercise (cardiac/pulmonary causes)
Associated Symptoms
- Neurologic (central)
  - Transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
- Persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
- Audioligic (peripheral)
  - Hearing loss, tinnitus, otalgia, aural fullness
- Others
  - N/V (peripheral vestibular disorders)
  - SOB, palpitations (hyperventilation, cardiac problem)
- General medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - Ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - Hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - Depression/anxiety: can present with light-headedness

Physical Exam/Investigations
- Syncopal
  - Cardiac (orthostatic changes in vials), peripheral vascular, and neurologic exams
  - Blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, and vertebral doppler, EEG
- Vertiginous
  - ENT and neurologic exams
  - Dix-Hallpike, consider audiometry and MRI if indicated
- Non-syncopal, non-vertiginous
  - Assess gait, vision and test for neuropathy
  - Cardiac and neurologic exams
  - 3-min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

Treatment
- Guided by history, physical exam, and investigations
- Include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- Refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

Domestic Violence/Elder Abuse

Intimate Partner Violence

Definition
- Includes physical, sexual, emotional, psychological, and financial abuse (see Emergency Medicine, ER28)

Epidemiology
- Lifetime prevalence of intimate partner violence against women is between 25-30%.
- Women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, stress-related problems.
- Occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, and 18-24 age group.
- 25-50% chance of child abuse or neglect in families where partner abuse occurs.
- Physician recognition rates as low as 5%.

Presentation
- Multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation.
- May also present with injuries inconsistent with history.

Management
- Screen ALL patients
  - Always have a high index of suspicion.
  - Asking about abuse is the strongest predictor of disclosure.
  - Several screening tools (see sidebar) exist to identify victims of partner violence.
  - Make sure to determine the victim’s level of immediate and long-term danger and ask if there are weapons in the house.
  - Ensure patient safety.
  - Victim most at risk for homicide when attempting to leave home or following separation.

Screening Instruments for Domestic Violence

A) Woman Abuse Screening Tool (WAST)-SHORT
1. In general how would you describe your relationship?
   a. A lot of tension
   b. Some tension
   c. No tension
2. Do you and your partner work out arguments with...
   a. Great difficulty
   b. Some difficulty
   c. No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely.

B) HITS
How often does your partner:
1. Physically hurt you?
2. Insult you?
3. Threaten you with harm?
4. Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)
A total score of 10.5 is significant.
• provide community resources
  ▪ safety planning includes ensuring that there is access to an exit in the home, establishing a safe place
to go and having money, clothes, keys, medications, important documents, and other emergency
  items prepared should the patient need to leave quickly
  ▪ shelter or helpline number with legal advocacy and counselling services
  ▪ involve social workers or domestic violence advocates
  ▪ appointment for follow-up to assess whether condition is better or worse
  ▪ reassure patient she/he is not to blame and that the assault is a crime
  ▪ goal is to convey the message that “As your doctor, I am concerned for your safety” and “Your
    partner has a problem that he/she needs help with” and “I want to help you”
  ▪ reporting suspected or known child abuse is mandatory
  ▪ spousal abuse is a criminal act, but not reportable without the woman’s/man’s permission
  ▪ DOCUMENT all evidence of abuse-related visits for medico-legal purposes

ELDER ABUSE

• see Geriatric Medicine, GM4

Dyspepsia

• see Gastroenterology, G10

Definition and Clinical Features

• defined as epigastric pain or discomfort
• can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

Epidemiology

• annual incidence 1-2%, prevalence 20-40%

Etiology

• common: functional, PUD, GERD, gastritis
• others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic
cancer, Zollinger-Ellison syndrome, and abdominal angina

History

• symptoms may not be useful in finding cause
• associated with eating, anorexia, N/V, alcohol, NSAID use
• red flags: vomiting, bleeding/ anemia, abdominal mass, dysphagia (VBAD)

Investigations and Management

• for new onset dyspepsia, test for H. pylori using the urea breath test or serology
• upper endoscopy (preferred), upper GI series (not in patients with alarm symptoms)
• lifestyle modifications: decreased caffeine and alcohol intake, avoid citrus food , avoid supine position
  right after meals, smoking cessation
• pharmacologic treatment
• gastric acid suppression: H2 blockers, PPIs; both are effective for PUD and GERD
• prokinetics: e.g. Metoclopramide; effective for functional dyspepsia
• H. pylori eradication
• do not keep patients on PPI without at least 1 trial off the medication per year
  (http://www.choosingwiselycanada.org/in-action/toolkits/buye-bye-ppi/)
• for non-responders, gastroscopy should be considered

Dyspepsia Red Flags

• Weight Loss
• Dysphagia
• Persistent vomiting
• GI bleeding (hematemesis, hematochezia, melena)
• Onset age >50

H. pylori Eradication

Take the following 10 day treatment

1) PPI 1 tablet 2x/d for 10 d and
2) Amoxicillin 1 g twice a day for 5 d (day 1-5)
Followed by
3) Clarithromycin 500 mg 2x/d (day 6-10) and
4) Metronidazole 500 mg 2x/d (day 6-10)

DDx of Dyspepsia

Pulmonary
• COPD
• Asthma
• Restrictive lung disease
• Pneumothorax
• Congenital lung disease
• PE

Cardiac
• CHF
• CAD
• MI (recent or past)
• Cardiomyopathy
• Valve dysfunction
• Pericarditis
• Arrhythmia
• Hypertrophy

Mixed/Other
• Deconditioning
• Trauma
• Pain
• Neuromuscular
• Metabolic condition
• Functional: anxiety, panic attack, hyperventilation

Dyspnea

• see Respirology, R3 and Emergency Medicine, ER26

Definition

• uncomfortable, abnormal awareness of breathing

History and Physical Exam

• history
  ▪ cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema, SOB
  ▪ asthma, allergy, eczema, ASA/NSAID sensitivity, nasal polyps
  ▪ constitutional symptoms
  ▪ smoking, recreational drugs, medications
  ▪ occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  ▪ travel and birth place
  ▪ FHx of atopy
  ▪ previous CXR or PFTs
• physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure
Common Presenting Problems

Investigations
- CXR, ECG
- PFTs, ABG acutely if indicated

Management
- ABCs: send to ED if in severe respiratory distress
- depends on cause

Dysuria
- see Urology, U10

Definition
- the sensation of pain, burning, or discomfort on urination

Epidemiology
- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per year
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

Etiology
- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypostrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

Table 17. Etiology, Signs and Symptoms of Common Causes of Dysuria

<table>
<thead>
<tr>
<th>Infection</th>
<th>Etiology</th>
<th>Signs and Symptoms</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTI/Cystitis</td>
<td>K. pneumonia, E. coli, Enterobacter, P. mirabilis, S. saprophyticus</td>
<td>Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare)</td>
</tr>
<tr>

<td>E. coli, S. saprophyticus, P. mirabilis, Enterobacter, K. pneumonia, P. saprophyticus</td>
<td>Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V</td>
</tr>
</tbody>
</table>

Investigations
- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for N. gonorrhoeae and C. trachomatis
- radiologic studies and other diagnostic tests if atypical presentation
- see Pediatrics, P62 for UTI in children

Management
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic, due to increased risk of pyelonephritis, preterm labour, low birth weight and perinatal mortality; need to follow with monthly urine cultures and retreat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
  - urethritis
    - when swab or PCR is positive for chlamydia or gonorrhea must report to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation
Epistaxis

• see Otolaryngology, OT26

Erectile Dysfunction

• see Urology, U30

Definition
• consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of ≥3 mo duration

Epidemiology
• ~20% of men age 40; ~50% of men age 70

Etiology
• organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie’s), neurologic (post-operative, DM), medications (clonidine, antihypertensives, psychotropics)
• psychogenic (10%)

</table>

Walsh: Campbell’s Urology, 8th ed. Table 46-4

History
• comprehensive sexual, medical, and psychosocial history
• time course
  • last satisfactory erection
  • gradual or sudden onset
  • attempts at sexual activity
• quantify
  • presence of morning or night time erections
  • stiffness (scale of 1-10)
  • ability to initiate and maintain an erection with sexual stimulation
  • erection stiffness during sex (scale of 1-10)
• qualify
  • partner or situation specific
  • loss of erection before penetration or climax
  • degree of concentration required to maintain an erection
  • percentage of sexual attempts satisfactory to patient and/or his partner
  • significant bends in penis or pain with erection
  • difficulty with specific positions
  • impact on quality of life and relationship

Investigations
• hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
• risk factor evaluation: fasting glucose, HbA1c, lipid profile
• others: TSH, CBC, urinalysis
• specialized testing
  • psychological and/or psychiatric consultation
  • in-depth psychosexual and relationship evaluation
  • nocturnal penile tumescence and rigidity (NPTR) assessment
  • vascular diagnostics (e.g. doppler studies, angiography)

DDx of Erectile Dysfunction

PENIS
Psychogenic
Endocrine (type 2 DM, testosterone)
Neurogenic (type 2 DM, post-operative)
Insufficiency of blood (atherosclerosis)

Reasons for Referral to Urology
• Significant penile anatomic disease
• Younger patient with a history of pelvic or perineal trauma
• Cases requiring vascular or neuro-surgical intervention
• Complicated endocrinopathies
• Complicated psychiatric or psychosocial problems
• Patient or physician desire for further evaluation

The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction

Arch Intern Med 2011;171:1797-1803
Study: Meta-analysis of 6 RCTs.
Population: 740 male participants.
Intervention: Lifestyle modification and pharmacotherapy targeting CAD risk factors.
Main Outcome Measure: International Index of Erectile Dysfunction (IIEF-5) score.
Results: Lifestyle modifications and pharmacotherapy for cardiovascular risk factors had a statistically significant association with improved sexual function (weighted mean difference 2.66; 95% CI 1.19-3.61). Lifestyle modification without use of statins was also statistically significantly associated with improved sexual function (weighted mean difference 2.40; 95% CI 1.19-3.61).
Conclusion: Lifestyle modification alone or combined with pharmacotherapy can improve sexual function.
Management

Fatigue

Epidemiology

- 25% of office visits to family physicians
  - peaks in ages 20-40
  - F:M = 3:4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

Differential Diagnosis

Table 21. Differential Diagnosis of Fatigue: PS VINDICATE

| P | Psychogenic | Depression, life stresses, anxiety disorder, chronic fatigue syndrome, fibromyalgia |
|   | Physiologic | Pregnancy, caregiving demands (young children, elderly) |
| S | Sleep disturbance | Obstructive sleep apnea, sleep disorder, poor sleep hygiene, BPH, shift work, pain |
|   | Sedentary | Unhealthy/sedentary lifestyle |
| V | Vascular | Stroke |
| I | Infectious | Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic |
| N | Neoplastic | Any malignancy |
|   | Nutrition | Anemia (Fe²⁺ deficiency, B₁₂ deficiency) |
|   | Neurogenic | Myasthenia gravis, multiple sclerosis, Parkinson’s disease |
| D | Drugs | β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants |
| I | Idiopathic |
| C | Chronic illnesses | CHF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease |
| A | Autoimmune | SLE, RA, mixed connective tissue disease, polymyalgia rheumatica |
| T | Toxin | Substance abuse (e.g. alcohol), heavy metal |
| E | Endocrine | Hypothyroidism, DM, Cushing’s syndrome, adrenal insufficiency, pregnancy |

Common causes are in bold

Investigations

- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations should be guided by history and physical exam and may include
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vitamin B₁₂, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
- additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests
Treatment
- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - quick follow-up for reassurance
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
  - prognosis: after 1 yr, 40% are no longer fatigued

CHRONIC FATIGUE SYNDROME

Definition (CDC 2006) – must meet both criteria
1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
2. concurrent presence of ≥4 of the following symptoms for a minimum of 6 mo
  - impairment of short-term memory or concentration, severe enough to cause significant decline in function
  - sore throat
  - tender cervical or axillary lymph nodes
  - muscle pain
  - multi-joint pain with no swelling or redness
  - new headache
  - unrefreshing sleep
  - post-exertion malaise lasting >24 h
  - exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

Epidemiology
- F>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

Etiology
- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

Investigations
- no specific diagnostic laboratory tests

Treatment
- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy,
  - antihypotensive therapy

Fever
- see Pediatrics, P51

Definition
- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr

Table 22. Differential Diagnosis of Fever

**History**
- fever
  - peak temperature, thermometer, route, duration
  - time of day
  - response to antipyretics
- systemic symptoms
- weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - URTI: cough, coryza, ear pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
  - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
  - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, day care, contact with TB, foodborne, animals

**Possible Investigations**
- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- LP

**Management**
- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

**Headache**

- see Neurology, N44

**Primary Headaches**

<table>
<thead>

</tbody>
</table>

**Secondary Headaches**
- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening
Etiology
- aneurysm
- medication overuse headache
- space-occupying lesion
- systemic infection (meningitis, encephalitis)
- stroke
- subarachnoid hemorrhage
- systemic disorders (thyroid disease, HTN, pheochromocytoma, etc.)
- temporal arteritis
- traumatic head injuries
- TMJ or C-spine pathology
- serious ophthalmological and otolaryngological causes of headache

Investigations
- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

Management
- based on underlying disorder
- analgesics may provide symptomatic relief

Hearing Impairment

Definition
- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

Epidemiology
- prevalence increases with age (6% of 35-44 yr old, 43% of 65-84 yr old)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr
- associated with significant physical, functional, and mental health consequences

Classification
- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea, or auditory nerve
- mixed

Assessment
- infants
  - universal newborn hearing screening program
- elderly
  - presbycusis is characterized by the progressive, symmetric loss of high-frequency hearing
  - tinnitus, vertigo, and disequilibrium may be present
  - can cause low self-esteem, isolation, and depression
  - whispered-voice test
  - whisper 6 test words 6 in-2.
  - tuning fork test (to distinguish conductive from sensorineural hearing loss)
  - Rinne and Weber (not for general screening)
  - formal audiologic assessment
  - pure tone, air, and bone conduction testing
  - speech audiometry
  - impedance audiometry

Management
- counsel about noise control and hearing protection programs (Grade A evidence)
- investigations in patients with unexplained sensorineural hearing loss
  - blood sugar, CBC+ differential, TSH, syphilis testing
- referral
  - refer patients with hearing loss for a complete audiological examination
  - unclear etiology of hearing loss: referral to ENT
  - sudden hearing loss: urgent referral as treatment success is related to early treatment
  - patients with progressive asymmetric sensorineural hearing loss should have an MRI/CT scan to exclude vestibular schwannoma (acoustic neuroma)
  - hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life.
Hypertension

Hypertension Guidelines are reviewed and updated annually, for up-to-date recommendations, please see www.hypertension.ca/chep

Epidemiology
- 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
- lifetime risk of developing hypertension is approximately 90%
- 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they have HTN
- 3rd leading risk factor associated with death
  - risk factor for CAD, CFE, cerebrovascular disease, renal failure, peripheral vascular disease

Definitions
- HTN
  - BP ≥140/90 mmHg, unless DM (≥130/80 mmHg), or age ≥80 yr (≥150/90 mmHg)
- isolated systolic HTN
  - sBP ≥140 and dBP <90
  - associated with progressive reduction in vascular compliance
  - usually begins in 5th decade
- hypertensive urgency
  - sBP >210 or dBP ≥120 with minimal or no target-organ damage
- hypertensive emergency
  - severe HTN + acute target-organ damage
  - accelerated HTN
    - significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy, but without papilledema
    - malignant HTN
      - sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
- white coat hypertension
  - high clinic BP with normal home BP and 24 ambulatory BP, caused by anxiety in clinic
- masked hypertension
  - normal clinic BP with high BP in home and/or ambulatory setting, often provoked by anxiety, job stress, exercise

Etiology
- essential (primary) HTN (>90%)
  - undetermined cause
  - secondary HTN (10%)

Predisposing Factors
- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- age >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

</tbody>
</table>

Investigations
- for all patients with HTN
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
- self-measurement of BP at home is encouraged (recommended devices listed at www.hypertension.ca)
- for specific patient subgroups
  - DM or chronic kidney disease; urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
Diagnosis
- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual

Treatment
- treat to target BP: <140/90 mmHg, <130/80 mmHg if DM, sBP<150 in very elderly (>80 yrs)
- optimum management of hypertension requires assessment of overall cardiac risk
- lifestyle modification (in all HTN patients)
  - may be sufficient in patients with stage 1 HTN (140-159/90-99)
  - diet
    - follow Canada’s Guide to Healthy Eating (see Nutrition, FM6) and Dietary Approaches to Stop Hypertension (DASH) (reduced cholesterol and saturated fats)
    - limit daily sodium intake to 65-100 mmol (1.5-2.3 g)
    - potassium/magnesium/calcium supplementations are NOT recommended for HTN
  - moderate intensity dynamic exercise: 30-60 min, 4-7 x/wk; higher intensity exercise is no more effective
  - smoking cessation
  - stress management
  - low-risk alcohol consumption (see Alcohol, FM12)
  - achieve and maintain a healthy BMI (18.5-24.9 kg/m²) and waist circumference (<102 cm for men, <88 cm for women); use multidisciplinary approach to weight loss
  - individualized cognitive behavioural interventions for stress management
- pharmacological
  - indications regardless of age (caution with elderly patients)
    - dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - sBP ≥140 with target organ damage
    - first line antihypertensives: thiazide/thiazide-like diuretic, ACEI (for non-African patients), ARB, long-acting CCB, β-blockers (if age <60)
    - if partial response to standard dose monotherapy, add another first-line drug
    - caution with combination of non-DHP CCB and β-blocker
    - combination of ACEI and ARB is not recommended
    - be cautious of hypokalemia in patients treated with thiazide/thiazide-like diuretic monotherapy
    - if still not controlled or adverse effects, can add other classes of anti-hypertensives
    - focus on adherence to health behaviour modification and pharmacotherapy; should be assessed at each visit

<tr>
<td><strong>If &gt;3 Cardiovascular Risk Factors or Established Atherosclerotic Disease</strong></td>
<td>Statin (age &gt;40), low-dose ASA (age &gt;50)</td>
<td>Caution with use of ASA in patients with uncontrolled BP</td>
<td></td>
</tr>
</tbody>
</table>

Follow-Up
• assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
• lifestyle modification q3-6mo
• pharmacological
  • q1-2mo until BP under target for 2 consecutive visits
  • more often for symptomatic HTN, severe HTN, antihypertensive drug intolerance, target organ damage
  • q3-6mo once at target BP
• referral is indicated for cases of refractory HTN, suspected secondary cause or worsening renal failure
• hospitalization is indicated for malignant HTN

Joint Pain

• see Rheumatology, RH3

</tbody>
</table>

History
• number of joints involved: monoarticular, oligoarticular, polyarticular
• pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
• onset: acute vs. chronic (>6 wk)
• trauma, infection, medications (steroids, diuretics)
• morning stiffness (duration) vs. worse at end of day
• FHx of arthritis
• comorbidities: DM (carpal tunnel syndrome), renal insufficiency (gout), psoriasis (psoriatic arthritis), myeloma (low back pain), osteoporosis (fracture), obesity (OA)
• constitutional symptoms (neoplasm)

Physical Exam
• vitals
• specific joint exams
• systemic features (skin, nails, eyes, hands)

Investigations (Guided by the History and Physical Exam)
• general: CBC and differential, electrolytes, Cr
• acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen
• complement (C3, C4)
• urine analysis to detect disease complications (proteinuria, active sediment)
• serology (ANA, anti-dsDNA, HLA-B27, anti-jo-1, anti-Sm, anti-Ro, RHF, and anti-CCP, etc.)
• synovial fluid analysis (cell count + differential, culture, Gram stain, microscopy)
• tissue cultures
• radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

Treatment
• patient education including lifestyle modifications
• physiotherapy, occupational therapy
• manage pain (acetaminophen, NSAIDs)
• treat specific causes (e.g. antibiotics, DMARDs etc., see Rheumatology, RH26)

Signs and Symptoms of Inflammatory Arthritis

WARM(S) Joints
Worse with rest, better with activity
Awakening in the latter half of the night
Morning stiffness (>30 min)
Soft tissue swelling, erythema

Systemic Features
• Fever (SLE, infection)
• Rash (SLE, psoriatic arthritis)
• Nail abnormalities (psoriatic, reactive arthritis)
• Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
• Myalgias (fibromyalgia, myopathy)
• Weakness (polymyositis, neuropathy)
• GI symptoms (scleroderma, IBD)
• GU symptoms (reactive arthritis, gonococcal)
Low Back Pain

- see Orthopedics, OR25

**Definition**
- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

**Epidemiology**
- 5th most common reason for visiting a physician
- lifetime prevalence: 90%
- peak prevalence: age 45-60
- largest WSIB category
- most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

**Etiology**
- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes
  - pain is worse with movement, better with rest
  - sprain (ligament), strain (muscle), facet joint degeneration, disc degeneration/herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture, pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
    - cauda equina syndrome (areflexia, lower extremity weakness, decreased anal tone, saddle anesthesia, fecal incontinence, urinary retention), AAA (pulsatile abdominal mass)
  - medical conditions
    - neoplastic (primary, metastatic, multiple myeloma)
    - infectious (osteomyelitis, TB)
    - metabolic (osteoporosis, osteomalacia, Paget's disease)
    - rheumatologic (ankylosing spondylitis, polymyalgia rheumatica)
  - referred pain (perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster)

**Physical Exam**
- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- ROM and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

**Investigations**
- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI
A Summary of the Guideline for the Evidence-Informed Primary Care Management of Low Back Pain

This evidence-informed guidelines is for non-specific, non-malignant low back pain in adults only.

Conduct a full assessment including:
- History taking
- Physical and neurological exam
- Evaluation of Red Flags
- Psychosocial risk factors/ Yellow Flags

Red Flags help identify rare, but potentially serious conditions. They include:
- Features of Cauda Equina Syndrome including sudden onset of loss of bladder/bowel control, saddle anesthesia (EMERGENCY)
- Severe worsening pain, especially at night or when lying down (URGENT)
- Significant trauma (URGENT)
- Weight loss, history of cancer, fever (URGENT)
- Use of steroids or intravenous drugs (URGENT)
- Patient with first episode over 50 years old, especially over 85 (SOON)
- Widespread neurological signs (SOON)

EMERGENCY — refer within hours
URGENT — refer within 24 – 48 hours
SOON — refer within weeks

Consider referring for evaluation and treatment (e.g., emergency room, surgical evaluation, relevant specialist)

ACUTE and SUBACUTE (within 12 weeks of pain onset)

1 – 6 WEEKS

Red flags (including Red Flags): if patient is not returning to normal function or symptoms are worrisome

Consider referral
- Physical therapist
- Chiropractor
- Osteopathic physician
- Physician specializing in musculoskeletal medicine
- Spinal surgeon (for unresolved radicular symptoms)
- Multidisciplinary pain program (if not returning to work)

Yellow Flags indicate psychosocial barriers to recovery. They include:
- Belief that pain and activity are harmful
- Stiffness behaviors (like extended rest
- Low or negative mood, social withdrawal
- Treatment expectations that do not fit best practice
- Problems with claim and compensation
- History of back pain, time-off, other claims
- Problems at work, poor job satisfaction
- Heavy work, unsociable hours (shift work)
- Disengaged family or lack of support

MODERATE TO SEVERE PAIN

Opioids (for appropriate patients: refer to the Canadian National Opioid Guideline endorsed by the College of Physicians and Surgeons of Alberta) (http://nationalpaincentre.mcmaster.ca/opioids)

Referral Options
- Community-based active rehabilitation program
- Community-based self-management/cognitive behavioral therapy program

Additional Options
- Progressive muscle relaxation
- Acupuncture
- Massage therapy, TENS as adjunct to active therapy
- Aqua therapy and yoga

Massage for Low Back Pain
Cochrane Syst Rev 2008;4:CD001192
This meta-analysis of 13 randomized trials assessed the use of massage therapy for non-specific low back pain compared to other active or sham treatments.

Conclusions: For some patients with subacute or chronic non-specific low back pain, massage may be beneficial, especially with education and exercises. Some evidence suggests that acupuncture massage may be more effective than classic massage but more studies are required to confirm these results.

Spinal Manipulative Therapy (SMT) for Acute Low-Back Pain
Cochrane Syst Rev 2012;9:CD008880
Conclusions: SMT is no more effective in participants with acute low-back pain than inert interventions, sham SMT, or when added to another intervention. SMT also appears to be no better than other recommended therapies.

Menopause/Hormone Replacement Therapy

- see Gynecology, GY34

Epidemiology
- mean age of menopause = 51.4 yr

Clinical Features
- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- blood vessels and heart: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

Management
- encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1,200-1,500 mg/d) and vitamin D (800-2,000 IU/d)
- hormone replacement therapy (HRT)
  - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
  - regimens: cyclic estrogen-progesterin, continuous estrogen-progesterin, estrogen only (if no uterus), estrogen patch/gel/cream/ring/vaginal tablet
  - decreases risk of osteoporotic fractures, colorectal cancer
  - increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
- consider venlafaxine, SSRI, or gabapentin to ease vasomotor instability

Osteoarthritis

- see Rheumatology, RH5

Epidemiology
- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

Clinical Features
- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

Investigations
- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

Management
- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g. canes, orthotics, raised toilet seats)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line NSAIDs in the lowest effective dose for the shortest duration of time, along with gastroprotection; COX-2 selective inhibitors (celecoxib/Celebrex®, Meloxicam/Mobicox®) are recommended if long-term treatment or if high risk for serious GI problems
  - combination analgesics (e.g. acetaminophen and codeine)
  - intra-articular hyaluronic acid injections
  - intra-articular corticosteroid injections (no more than 3-4x/yr) may be helpful in acute flares (benefits last 4-6 wk, can be up to 6 mo)
  - topical NSAIDs (diclofenac/Pennsaid®)
  - capsacin cream (Zostrix®)
  - oral glucosamine
  - surgery
- consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

Glucosamine Therapy for Treating Osteoarthritis

This meta-analysis of 25 single- and double-blinded randomized controlled trials with 4,963 patients compared glucosamine treatment, administered by any route, against placebo or another treatment.
Conclusions: Glucosamine can decrease pain and functional impairment resulting from OA and is not associated with any side effects compared to placebo. Differences in the effectiveness of Rotta and non-Rotta preparations highlight variability between glucosamine preparations and patients should be made aware of this.
Osteoporosis

- see Endocrinology, E40
- for current guidelines and tools see www.osteoporosis.ca
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- affects 1 in 4 Canadian women and 1 in 8 Canadian men

**Management**
- see Endocrinology, E40

**Palliative and End-of-Life Care**
- see Geriatric Medicine, GM12

**Rash**

**ATOPIC DERMATITIS**
- affects all ages but is more common in children
- pruritus is the most common symptom; scratching worsens the rash creating a vicious cycle

**treatment**
- goals: limit itching, repair skin
- moisturizers, emollients, topical corticosteroids; oral corticosteroids and topical calcineurin inhibitors may be used
SEBORRHEIC DERMATITIS

- clinical features
  - affects all ages but is most common in infants within the first 3 mo of life (e.g. pityriasis capitis or “cradle cap”) and adults age 30-60 yr
  - affects the scalp, central face, and anterior chest; often presents as scalp scaling (dandruff) in adolescents and adults
  - may cause mild to marked erythema of the nasolabial fold, often with greasy scaling
- treatment
  - topical antifungals, topical low-potency steroids; topical calcineurin inhibitors may be used

ROSacea

- clinical features
  - stages: (1) facial flushing, (2) erythema and/or edema and ocular symptoms, (3) papules and pustules, (4) rhinophyma
- treatment
  - topical or oral antibiotics, oral retinoids
  - laser treatment may be an option for progressive telangiectasias or rhinophyma
  - referral may be required to manage rhinophyma, ocular complications, or severe disease

ACNE Vulgaris

- clinical features
  - types: (I) comedonal, (II) papular, (III) pustular, (IV) nodulocystic
  - predilection for the face, neck, upper chest, and back
- treatment
  - mild acne: topical treatments (antibiotics, benzoyl peroxide, retinoids)
  - moderate acne: after topical treatments have failed, add oral antibiotics and consider hormonal therapy
  - severe acne: consider systemic retinoids

ONYCHOMYCOSIS (Tinea Unguium)

- definition: fungal infection of the nail bed, matrix, or plate
- clinical features
  - occurs primarily in adults, most commonly after age 60
  - crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris
  - toenails are affected more often than fingernails
- investigations
  - microscopy of subungual scrapings under KOH preparation, culture
- treatment
  - oral antifungals (terbinafine/Lamisil™, itraconazole/Sporanox™), topical antifungals (ciclopirox/ Loprox™) are less effective

Sexually Transmitted Infections

- see Gynecology, GY27

Definition

- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

Epidemiology

- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes (increasing incidence of chlamydia and gonorrhea)
  - less common: hepatitis B, HIV, and syphilis (increasing in incidence), trichomoniasis
  - rare: chancre, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

History

- sexual history
  - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, contraception, previous STIs and testing (including Pap tests), partner communication regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

STI Risk Factors

- Sexually active males and females < 25 yr old
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or > 2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance abuse

Sexual History

S P’s
- Partners (numbers, gender)
- Practices (vaginal, oral, anal insertive/receptive)
- Protection
- Past history of STIs
- Pregnancy prevention
Investigations/Screening
- individuals at increased risk, even those who are asymptomatic, should be screened for chlamydia, gonorrhea, hepatitis B, HIV, and syphilis
- Pap test if none performed in the preceding 12 mo

Management
- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil® to women over 9 years of age (can be offered to men as well but not covered by OHIP)
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HIV or HSV
- an STI patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonal infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis

Table 28. Diagnosis and Treatment of Common STIs

<table>
<thead>
<tr>
<th>Signs and Symptoms</th>
<th>Investigations</th>
<th>Treatment</th>
<th>Complications</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Gonococcal Urethritis/ Cervicitis</strong> (Neisseria gonorrhoeae)</td>
<td>M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, SX of epididymitis F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain, dyspareunia M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex</td>
<td>M: urine swab for Gram stain and culture F: urine PCR, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomons) M and F: urine PCR, rectal/ pharyngeal swabs if indicated</td>
<td>Ceftriaxone 250 mg IM single dose* If risk factors for treatment failure (e.g. pregnancy, pharyngeal/rectal infection, potentially reduced susceptibility) Test of cure: culture 4 d post-treatment (preferred) or urine PCR 2 wk post treatment (alternative) If no risk factors, rescreen 6-12 months post treatment</td>
</tr>
<tr>
<td><strong>Non-Gonococcal Urethritis/Cervicitis</strong> (Usually Chlamydia trachomatis**)</td>
<td>~ 70% asymptomatic If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above)</td>
<td>Same as above</td>
<td>Same as above</td>
</tr>
<tr>
<td><strong>Human Papillomavirus</strong> (genital warts, cervical dysplasia)</td>
<td>Most are asymptomatic M: cauliflower lesions (condyloma acuminata) on skin/mucosa of penile or anal area F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva</td>
<td>None needed if simple condyloma Potential biopsy of suspicious lesions F: screening for cervical dysplasia through regular Pap smears</td>
<td>For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based) For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion</td>
</tr>
<tr>
<td><strong>Genital Herpes</strong> (HSV-1 and -2)</td>
<td>1° episode: painful vesiculocurative genital lesions = fever, tender lymphadenopathy, protracted course Recurrent episodes: less extensive lesions, shorter course may have “trigger factors”</td>
<td>Swab of vesicular content for culture, type-specific serologic testing for HSV-1 vs. HSV-2 antibodies and to determine 1° vs. recurrent episode</td>
<td>1° Episode Acyclovir 200 mg PO 5x/day x 5-10 d or Valacyclovir 1,000 mg PO bid x 10 d Recurrent Episode Acyclovir 200 mg PO 5x/day x 5d or 800 mg PO tid x 2 d or Famiciclovir 125 mg PO bid x 5 d or Valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d</td>
</tr>
<tr>
<td><strong>Infectious Syphilis</strong> (Treponema pallidum)</td>
<td>1°: chancre (painless sore), regional lymphadenopathy 2°: rash and flu-like symptoms, meningitis, H/A, urethritis, reitinitis, condyloma lata, mucus lesions, alopecia Late Phase: asymptomatic 3°: neurologic, cardiovascular, and tissue complications</td>
<td>Specimen collection from 1° and 2° lesions, screen high risk individuals with serologic syphilis testing (VGRIL), universal screening of pregnant women</td>
<td>Benzathine penicillin G IM (dose depends on stage and patient population. Check Public Health Canada guidelines) Notify partners (last 3-12 mo) Continuous follow-up and testing until patients are seronegative</td>
</tr>
</tbody>
</table>
Sinusitis

- see Otolaryngology, OT24

Etiology
- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: S. pneumoniae, H. influenzae, M. catarrhalis

Management of Acute Sinusitis
- may provide symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants
- do not prescribe antihistamines
- intra-nasal corticosteroids if diagnosed with mild to moderate acute bacterial sinusitis
- antibiotics and intra-nasal corticosteroids if diagnosed with severe acute bacterial sinusitis
- ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, ≥4 episodes/yr, development of complications (e.g. mucocele, orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis)

Figure 15. Diagnosis and management of sinusitis

ABRS = acute bacterial rhinosinusitis
Sleep Disorders

• see Respirology, R31 and Neurology, N46

Definition
• most often characterized by one of three complaints
  ■ insomnia
    • difficulty falling asleep, difficulty maintaining sleep, early-morning wakening, non-refreshing sleep
  ■ parasomnias
    • night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
    • excessive daytime sleepiness

Epidemiology
• 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

Etiology
• primary sleep disorders
  ■ primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
• secondary causes
  ■ medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
  ■ drugs: alcohol, caffeine, nicotine, nicotine replacement therapy, β-agonists, antidepressants, steroids
  ■ psychiatric: mood and anxiety disorders
  ■ lifestyle factors: shift work, jet-lag

Investigations
• complete sleep diary every morning for 1-2 wk
  ■ record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
• rule out specific medical problems (e.g. CBC and differential, TSH)
• refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic limb movements of sleep

Treatment of Specific Problems
• Primary insomnia
  ■ majority of cases
  ■ person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  ■ treat any suspected medical or psychiatric cause
  ■ behaviour-based treatment
    ■ sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
    ■ exercise regularly, avoid heavy exercise within 3 h of bedtime
    ■ relaxation therapy: deep breathing, meditation, biofeedback
    ■ stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    ■ sleep restriction therapy: total time in bed should closely match the total sleep time of the patient (improves sleep efficacy)
    ■ CBT: address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  ■ pharmacologic treatment
    ■ short-acting benzodiazepines (e.g. lorazepam, oxazepam, temazepam) at the lowest effective dose should be used <7 consecutive nights to break cycle of chronic insomnia or to manage an exacerbation of previously controlled primary insomnia
    ■ non-benzodiazepines: zopiclone (Imovane®), zolpidem (Sublinox®), melatonin, low dose antidepressants with sedating properties (amitriptyline, trazadone, mirtazapine)
    ■ follow-up every 2-4 wk initially (to reinforce behavioural interventions and renew/consider pharmacotherapy) then every 3 mo; if no progress or limited improvement, consider referral to sleep medicine program

• Snoring
  ■ results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  ■ physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  ■ investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  ■ treatment
    ■ sleep on side (position therapy), weight loss
    ■ nasal dilators (noninvasive external dilator made with elastic adhesive backing applied over nasal bridge), tongue-retaining devices, mandibular advancement devices
    ■ at risk of developing obstructive sleep apnea
• **Obstructive Sleep Apnea (OSA)**
  - apnea (no breathing for ≥10 s) resulting from upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
  - leads to a distinctive snorting, choking, awakening type pattern as the body rouses itself to open the airway (resuscitative breath)
  - apneic episodes can last from 20 s-3 min and occur 100-600 episodes/night
  - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per hour of sleep with arousal recorded
  - consequences
    - daytime somnolence, non-restorative sleep
    - poor social and work performance
    - mood changes: anxiety, irritability, depression
    - sexual dysfunction: libido, impotence
    - morning headache (due to hypercapnia)
    - HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
  - OSA is an independent risk factor for CAD
  - pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
  - memory loss, decreased concentration, confusion
  - investigations
    - valuate BP, inspect nose and oropharynx (enlarged adenoids or tonsils)
    - blood gas not helpful, TSH if clinically indicated
    - nocturnal polysomnography
  - treatment
    - modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
    - primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
    - surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
    - report patient to Ministry of Transportation if OSA is not controlled by CPAP

---

**Sore Throat (Pharyngitis)**

**Definition**
- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

**Etiology**
- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: Group A β-Hemolytic Streptococcus (GABHS), Group C and Group β-Hemolytic Streptococcus, Neisseria gonorrhoeae, Chlamydia pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae

**Epidemiology**
- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - GABHS (Group A β-Hemolytic Streptococcal Infections)
    - most common bacterial cause
    - occurs most often in winter months
    - 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
    - most prevalent between 5-17 yr old

**Clinical Features**
- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
- common viral infections
  - EBV (infectious mononucleosis)
    - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
  - coxsackie virus (hand, foot, and mouth disease)
    - primarily late summer, early fall
    - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
    - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
  - herpes simplex virus
    - like coxsackie virus but ulcers are fewer and larger
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
• bacterial
  ■ symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  ■ signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  ■ complications: rheumatic fever, glomerulonephritis, suppurrative complications (abscess, sinusitis, otitis media, cervical adenitis, pneumonia), meningitis, impetigo

Investigations
• suspected GABHS
  ■ see Table 29 for approach to diagnosis and management of GABHS
  ■ gold standard for diagnosis is throat culture
  ■ rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
  ■ suspected EBV (infectious mononucleosis)
    ● peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or “monospot”)

Table 29. Modified Centor Score: Approach to Diagnosis and Management of GABHS

<td>NO culture or antibiotic</td>
<td>Culture all, treat with antibiotics only if culture is positive</td>
<td>Culture all, treat with antibiotics on clinical grounds, discontinue antibiotics if culture comes back negative</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Management
• viral pharyngitis
  ■ antibiotics not indicated
  ■ symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
• GABHS
  ■ antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurrative complications
  ■ incidence of glomerulonephritis is not decreased with antibiotic treatment
  ■ no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  ■ routine F/U and/or post-treatment throat cultures are not required for most patients
  ■ F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
• infectious mononucleosis (EBV)
  ■ self-limiting course; antibiotics are not indicated
  ■ symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  ■ avoid heavy physical activity and contact sports for at least one month or until splenomegaly resolves because of risk of splenic rupture
  ■ if acute airway obstruction, give corticosteroids and consult ENT
Complementary and Alternative Medicine

**Epidemiology**
- 50-75% of Canadians report some use of CAM over their lifetime, and only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

**Herbal Products**
- over 50% of Canadians use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John’s wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - Are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - Are you allergic to any plant products?
  - Are you pregnant or breastfeeding?
- information resources: National Center for CAM (www.nccam.nih.gov), Health Canada website

<tr>
<td></td>
<td>(protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K)</td>
<td></td>
<td>Sympathetic innervation via fibres of T8-T10</td>
<td>2-4 cm in thickness</td>
</tr>
<tr>
<td>Illeum</td>
<td>Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B12 absorption), and bile salts (entero-hepatic circulation)</td>
<td>Superior mesenteric artery</td>
<td>Same as jejunum</td>
<td>Thick and heavy wall</td>
</tr>
<tr>
<td>Large Bowel</td>
<td>Absorption of water (5-10% of total water)</td>
<td>Branches of superior and inferior mesenteric arteries</td>
<td>When compared to jejunum</td>
<td>Plicae circulares are large, tall, and closely packed</td>
</tr>
<tr>
<td></td>
<td>Bacteria: further digestion of chyme and metabolism of undigested CHO</td>
<td>Rectal blood supply: sigmoid, right pudendal, and rectal arteries</td>
<td>Paler pink colour</td>
<td>Has long vasa recta</td>
</tr>
<tr>
<td></td>
<td>to short chain fatty acids</td>
<td></td>
<td>Scant fat in mesentery</td>
<td>Szent Peyer’s patches</td>
</tr>
<tr>
<td></td>
<td>Formation and storage of feces</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Liver</td>
<td>Glucose homeostasis</td>
<td>2 sources</td>
<td>Largest internal organ</td>
<td>Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal</td>
</tr>
<tr>
<td></td>
<td>Plasma protein synthesis</td>
<td>Portal vein (75-80%)</td>
<td>Composed of 4 lobes (left, right, caudate, quadrato), and divided into 8 segments</td>
<td>Features include teniae cell, haustra, and omental appendices</td>
</tr>
<tr>
<td></td>
<td>Lipid and lipoprotein synthesis</td>
<td>Hepatic artery (20-25%)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Biliary Tract</td>
<td>Gallbladder functions to store and release bile that is produced in the liver</td>
<td>Cystic artery</td>
<td>Parasympathetic innervation via vagus nerve</td>
<td>Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater</td>
</tr>
<tr>
<td></td>
<td>Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids, and bilinilin</td>
<td></td>
<td>Sympathetic and visceral innervation via celiac plexus</td>
<td></td>
</tr>
<tr>
<td></td>
<td>CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release</td>
<td></td>
<td>Somatic afferent fibres via right phrenic nerve</td>
<td></td>
</tr>
<tr>
<td>Pancreas</td>
<td>Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin</td>
<td>Anterior superior pancreaticoduodenal artery (from the celiac trunk)</td>
<td>Parasympathetic innervation via vagus nerve</td>
<td>4 parts of pancreas: head (includes uncinate process), neck, body, and tail (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater</td>
</tr>
<tr>
<td></td>
<td>Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase</td>
<td>Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery)</td>
<td>Sympathetic innervation via abdominopelvic splanchnic nerves</td>
<td>Accessory pancreatic duct connected directly to duodenum</td>
</tr>
<tr>

<tr>
<td></td>
<td></td>
<td>Pancreatic veins drain into the portal, splenic, and superior mesenteric veins</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Visualizing the GI Tract

- see Medical Imaging, MI15

Esophagus, Stomach, Duodenum
- OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation e.g. treatment of esophageal strictures)
  - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulas
  - endotracheal intubation first if massive upper GI bleed, acidemia, or inability to protect airway

Small Bowel
- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
  - note: MRI enteroclysis: luminal contrast administered by nasojejunal tube to dilate the small bowel – disliked by both radiologist and patient, but may improve sensitivity
  - “double balloon” enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum or into ileus from anus) may be most sensitive but currently available only in selected centres; technically demanding
  - wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

Colon and Terminal ileum
- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography (“virtual colonoscopy”) more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is less sensitive. Most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture).
  - most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture)

Pancreatic/Biliary Duct
- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if therapeutic intervention likely to be required: strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required

Differential Diagnosis of Common Complaints

- see General Surgery, Acute Abdominal Pain, GS4

Table 2. Differential Diagnosis of Common Presenting Complaints

</table>

Inflammatory Diarrhea: Occurs when there is damage to the mucosal lining or brush border, which leads to a passive loss of protein-rich fluids and a decreased ability to absorb these lost fluids. Diarrhea may be profuse or very small in volume. Often associated with abdominal pain, fever and cramps.

Non-Inflammatory Diarrhea: No damage to the mucosal lining. N/V may be present. Fever, chills, blood in the stool, severe abdominal pain or tenderness are not present.

Esophagus

Gastroesophageal Reflux Disease

Definition
- condition in which the stomach contents (most characteristically acid) moves backwards from the stomach into the esophagus

Etiology
- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see General Surgery, GS13)

Clinical Features
- "heartburn" (pyrosis) and acid regurgitation (together are 80% sensitive and specific for reflux) ± sour regurgitation; less sensitive and less specific: water brash, sensation of a lump in the throat (globus sensation), and frequent belching
- non-esophageal symptoms are increasingly recognized of being poor predictors of reflux

Investigations
- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
  - absolute indications
    - heartburn accompanied by red-flags (bleeding, weight loss, etc.)
    - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
    - history suggests esophageal stricture especially dysphagia
    - high risk for Barrett’s (male, age >50, obese, white, tobacco use, long history of symptoms)
    - repeat endoscopy after 6-8 wks of PPI therapy indicated if: severe esophagitis because it can mask Barrett’s esophagus or symptoms
    - esophageal manometry (study of esophageal motility)
    - done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function

Figure 2. Signs and symptoms of GERD

Gastroesophageal Reflux Disease

Gastroscopy

Non-erosive reflux disease (NERD)
Normal esophagus
Aim for symptom relief only; proton pump inhibitor PRN

Esophagitis
Esophageal inflammation
Aim to heal inflammation; proton pump inhibitor indefinitely or surgical fundoplication

Figure 3. Classification and gastroscopic findings of GERD

Bowel Ischemia
The splenic flexure and rectosigmoid junction are watershed areas and are susceptible to ischemia. History and symptoms include acute onset crampy left abdominal pain, absence of abdominal tenderness on exam, rectal bleeding, and risk factors for embolization, atherosclerosis and atrial fibrillation

Dyspepsia = postprandial fullness, early satiety, epigastric pain, or burning

Foods/Substances that Aggravate GERD
- EOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices
• surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
• 24 h pH monitoring: most accurate test for reflux, but not required or performed in most cases
• most useful if PPIs do not improve symptoms

Treatment
• PPIs are the most effective therapy and usually need to be continued as maintenance therapy
• on-demand: antacids (Mg(OH)₂, Al(OH)₃, alginate), H₂-blockers, or PPIs can be used for NERD
• diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes, and citrus juices
• only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
• symptoms may recur if therapy is discontinued

Complications
• esophageal stricture disease – scarring can lead to dysphagia (solids)
• ulcer
• bleeding
• Barrett’s esophagus and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

Barrett’s Esophagus

Definition
• metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

Etiology
• thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

Epidemiology
• in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett’s esophagus
• up to 10% of GERD patients will have already developed BE by the time they seek medical attention
• more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

Pathophysiology
• endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
• BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

Significance
• rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
• risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance
• increased gastric acid secretion is more frequently associated with Barrett’s esophagus as opposed to reflux alone

Treatment
• acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
• endoscopy every 3 yr if no dysplasia
• high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
• if low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options
# Dysphagia

**Definition**
- difficulty swallowing

**Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)**

### Esophageal Motor Disorders

**Clinical Features**
- dysphagia with solids and liquids
- chest pain (in some disorders)

**Diagnosis**
- motility study (esophageal manometry)
- barium swallow sometimes helpful

**Causes**
- idiopathic
- achalasia (painless)
- scleroderma (painless)
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

**Table 3. Esophageal Motor Disorders**

<table>
<thead>
<tr>
<th>Disorder</th>
<th>Achalasia</th>
<th>Scleroderma</th>

<tr>
<td><strong>Definition</strong></td>
<td>Failure of smooth muscle relaxation at LES&lt;br&gt;Progressive loss of peristaltic function</td>
<td>See Rheumatology, RH13&lt;br&gt;Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening)</td>
<td>Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)</td>
</tr>
<tr>
<td><strong>Etiology</strong></td>
<td>Usually idiopathic&lt;br&gt;2º or pseudo-achalasia: e.g. malignancy, Chagas disease (Trypanosoma cruzi)</td>
<td>Involves autoimmune, genetic, hormonal, and environmental factors&lt;br&gt;Idiopathic</td>
<td>Idiopathic</td>
</tr>
<tr>
<td><strong>Pathophysiology</strong></td>
<td>Inflammatory degeneration of Auerbach’s plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis</td>
<td>Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia</td>
<td>Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis</td>
</tr>
<tr>
<td><strong>Diagnosis</strong></td>
<td>CXR: no air in stomach, dilated esophagus&lt;br&gt;Barium studies: esophagus terminates in narrowing at LES (“bird’s beak”)&lt;br&gt;Endoscopy: normal mucosa&lt;br&gt;Manometry: definitive diagnosis (signs listed above)</td>
<td>Clinical features of scleroderma&lt;br&gt;Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus</td>
<td>Barium x-ray: “Corkscrew pattern”&lt;br&gt;Manometry: &gt;30% (but &lt;100%) of esophageal contractions are aperistaltic&lt;br&gt;Endoscopy: normal mucosa</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td>Dilatation of LES with balloon, = GERD prophylaxis, 50% good response, can repeat, risk of perforation (5%)&lt;br&gt;Injection of botulinum toxin into LES (temporary)&lt;br&gt;POEM (peroral endoscopic myotomy)</td>
<td>Medical: aggressive GERD therapy&lt;br&gt;PPis bid&lt;br&gt;Surgery: anti-reflux surgery (gastropasty, last resort)</td>
<td>Reassurance not cardiac pain&lt;br&gt;Medical: nitrates, calcium channel blockers, anticoagulants have variable benefit&lt;br&gt;Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful); balloon dilatation</td>
</tr>
</tbody>
</table>
Esophageal Diverticula

Definition
• outpouchings of one or more layers of the esophageal tract

Clinical Features
• commonly associated with motility disorders
• dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

Classification
• classified according to location
  • pharyngoesophageal (Zenker’s) diverticulum
    • most frequent form of esophageal diverticulum
  • posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
  • symptoms: dysphagia, regurgitation of undigested food, halitosis
  • treatment: endoscopic or surgical myotomy of cricopharyngeal muscle or surgical excision of sac
  • mid-esophageal diverticulum
    • secondary to mediastinal inflammation (“traction” diverticulae), motor disorders
    • usually asymptomatic; no treatment required
  • just proximal to LES (pulsatile type)
    • usually associated with motor disorders
    • usually asymptomatic, no treatment required

Peptic Stricture (from Esophagitis)
• presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
• diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

Treatment
• endoscopic dilatation and indefinite PPI

Esophageal Carcinoma
• see General Surgery, GS15

Webs and Rings
• web = partial occlusion (upper esophagus)
• ring = circumferential narrowing (lower esophagus)

Clinical Features
• asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
• dysphagia with large food boluses
• Schatzki ring
  • mucosal ring at squamo-columnar junction above a hiatus hernia
  • causes intermittent dysphagia with solids
  • treatment involves disrupting ring with endoscopic bougie

Infectious Esophagitis

Definition
• severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

Risk Factors
• DM
• chemotherapeutic agents
• immunocompromised states

Clinical Features
• characteristically odynophagia, less often dysphagia
• diagnosis is via endoscopic visualization and biopsy

Appearance
• Candida (most common): whitish-yellow plaques without visible ulceration or inflammation
• Herpes (second most common), CMV: focal ulcers

Plummer-Vinson Syndrome Triad
• Iron deficiency anemia
• Dysphagia
• Esophageal webs
* rare (prevalence <1 in 1,000,000) but good prognosis when treated with iron and esophageal dilatation

Eosinophilic Esophagitis
• Eosinophils infiltrate the epithelium of the esophagus
• Causes odynophagia, dysphagia, common cause of bolus food impaction
• Usually primary, but can be part of the spectrum of eosinophilic gastroenteritis, secondary to drugs, parasites etc.
• Often associated with allergies
• Most characteristically occurs in young men
• Diagnosis established by endoscopic biopsy, suggested by mucosal rings seen in the esophageal mucosa at endoscopy
• Treatment: (a)diet, (b)swallow corticosteroid nasal spray (fluticasone), (c)swallow viscous corticosteroid (budesonide mixed with sucralose
Investigations
- diagnosis via endoscopic visualization and biopsy

Treatment
- Candida: nystatin swish and swallow, ketoconazole, fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV gancyclovir, famciclovir, or oral valganciclovir

Stomach and Duodenum

Dyspepsia

Definition
- one or more of the following symptoms: postprandial fullness, early satiation, epigastric pain or burning (Rome III criteria)
- multiple causes: esophagitis, GERD, peptic ulcer, stomach cancer, drugs, but overall functional disease is most common

History and Physical Exam
- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett’s sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

Investigations
- laboratory: usual (CBC, liver enzymes, glucose, Cr, etc.), amylase, albumin, calcium, protein electrophoresis, TSH, H. pylori serology
- consider trial of empiric anti-secretory drug therapy, non-invasive testing for H. pylori infection, endoscopy; barium radiography is outdated

Gastritis

Definition
- defined histologically: inflammation of the stomach mucosa

Etiology
- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

Table 5. Updated Sydney Classification of Gastritis

<table>
<thead>
<tr>
<th>Type</th>
<th>Common Etiology</th>

<td>H. pylori*</td>
</tr>
</tbody>
</table>

Chronic Gastritis
- Non-atrophic
- Atrophic
- Chemical
- Radiation
- Lymphocytic
- Eosinophilic
- Non-infectious granulomatous
- Other infectious gastritides

Clinical Features
- non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn’s disease), does not cause pain; difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

Treatment
- determined by etiology (see H. pylori, G13, NSAID, G13 and Stress-Induced Ulceration, G14)
- non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs, and foods that trigger symptoms

Peptic Ulcer Disease

Definition
- focal defects in the mucosa that penetrate the muscularis mucosal layer results in scarring (defects superficial to the muscularis mucosa are erosions and do not cause scarring)
- peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

Etiology

Table 6. Etiology of Peptic Ulcer Disease

<table>
<thead>
<tr>
<th></th>

<td>&lt;1%</td>
<td>&lt;1%</td>
</tr>
<tr>
<td>Idiopathic</td>
<td>15%</td>
<td>10%</td>
</tr>
</tbody>
</table>

- NSAID negative, H. pylori negative ulcers becoming more commonly recognized
- others: CMV, ischemic, idiopathic
- alcohol: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with cigarette smoking, cirrhosis of liver, COPD, and chronic renal failure

Clinical Features
- dyspepsia: most common presenting symptom
  - only 5% of patients with dyspepsia have ulcers, while most have functional disease
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery), perforation 2% (usually anterior ulcers), gastric outlet obstruction 2%
  - posterior inflammation (penetration) 2%; may also cause pancreatitis
• duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  • epigastric pain; may localize to tip of xiphoid
  • burning
  • develops 1-3 h after meals
  • relieved by eating and antacids
  • interrupts sleep
  • periodicity (tends to occur in clusters over wk with subsequent periods of remission)
• gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

Investigations
• endoscopy (most accurate)
• upper GI series
• H. pylori tests (see Table 7)
• fasting serum gastrin measurement if Zollinger-Ellison syndrome suspected (but most common cause of elevated serum gastrin level is atrophic gastritis)

Treatment
• specific management depends on etiology; (see H. pylori, GI3, NSAID-Induced Ulceration, GI3 and Stress-Induced Ulceration, G14)
• eradicate H. pylori if present; chief advantage of triple therapy over PPI is to lower ulcer recurrence rate
• stop NSAIDs if possible
• start PPI: inhibits parietal cell H+K+ ATPase pump which secretes acid
• heals most ulcers, even if NSAIDs are continued
• other medications (e.g. histamine H2-antagonists) less effective
• discontinue cigarette smoking
• no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol, and spices

Management of Bleeding Peptic Ulcers
• OGD to explore upper GI tract
• IV pantoprazole continuous drip
• establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  • clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
• endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
  • if high risk, consider ICU admission

Suspected Bleeding Peptic Ulcer
ABCs: assess vitals (BP and HR, orthostatic changes)
CBC, lytes, BUN, Cr, INR, blood type, cross and type
Resuscitate: crystalloids and blood products if indicated

Consider
NG tube placement + aspiration: confirm upper GI source
IV pantoprazole: 80 mg starting dose + 8 mg/h continuous infusion
Erythromycin 250 mg 30 min before endoscopy

Endoscopy
Active bleeding or visible vessel
High Risk:
Hemostasis: clips, thermal coagulation, epinephrine injection
Continue (or start) IV PPI
Monitor for re-bleeding in hospital
If adherent clot: consider removal
Low Risk:
No hemostasis necessary
Continue (or start) oral PPI
Decreased need for in-hospital monitoring

Post-Endoscopy
Resume clear fluids 6 hours post-endoscopy
Test for H. pylori
Counsel re: most likely causes (NSAIDs, anti-platelet agents)
If re-bleeding: repeat endoscopy with aim of hemostasis
Consult interventional radiology or surgery if needed

Figure 6. Approach to management of suspected bleeding peptic ulcer
Adapted from: Graheik J, Barkun A, Barkou M. Management of acute bleeding from a peptic ulcer. NEJM 2008;359:928-937

Gastric vs. Duodenal Ulcers
Gastric ulcers must always be biopsied to rule out malignancies; duodenal ulcers are rarely malignant

Approach to PUD
• Stop NSAIDs
• Acid neutralization
• H. pylori eradication
• Quit smoking

Bleeding Peptic Ulcers
Risk Factors for Increased Mortality
• Co-existent illness
• Hemodynamic instability
• Age > 60 yr
• Transfusion required
**H. pylori-Induced Peptic Ulceration**

**Pathophysiology**
- *H. pylori*: Gram-negative flagellated rod that resides within the gastric mucosa, causing persistent infection and inflammation
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- theories of how *H. pylori* causes ulcers: none satisfactory, but pattern of colonization correlates with outcome
- gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
- gastritis throughout stomach (“pangastritis” – 85% of patients), low gastric acid, associated with stomach ulcer and cancer

**Epidemiology**
- *H. pylori* is found in about 20% of all Canadians
- highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

**Outcome**
- gastritis (non-erosive) in 100% of patients but asymptomatic
- peptic ulcer in 15% of patients
- gastric carcinoma and mucosal associated lymphomatous tissue [MALT] lymphoma in 0.5% of patients
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children <5 yr of age)

**Diagnosis**

**Treatment: H. pylori Eradication**
- triple therapy for 7-14 d (Hp-Pac®): PPI bid (e.g. lansoprazole 30 mg bid) + amoxicillin 1 g bid + clarithromycin 500 mg bid
- becoming less successful as prevalence of *H. pylori* clarithromycin-resistance increases
- quadruple therapy for 10-14 d now recommended: PPI bid + bismuth 525 mg qid + tetracycline 500 mg qid + metronidazole 250 mg qid
- levofloxacin can replace metronidazole or tetracycline
- sequential therapy
- days 1-5: PPI bid + amoxicillin 1 g bid
- days 6-10: PPI bid + clarithromycin 500 mg bid + tinidazole (generally substitute with metronidazole as tinidazole not available in Canada) 500 mg bid
- 5-15% of cases are resistant to all known therapies

**NSAID-Induced Ulceration**
- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
- erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically silent: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

**Pathophysiology**
- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions), inhibits mucosal cyclooxygenase, leading to decreased synthesis of protective prostaglandins, thus leading to ulcers
Risk Factors for NSAID-induced Peptic Ulcer
- previous peptic ulcers/UGIB
- age (≥65 yr)
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

Treatment
- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol (less effective) in one tablet
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

Stress-Induced Ulceration

Definition
- ulceration or erosion in the upper GI tract of ill patients, usually in ICU (stress is physiological, not psychiatric)
- lesions most commonly in fundus of stomach

Pathophysiology
- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing ulcers
- mechanical ventilation is the most important risk factor

Risk Factors
- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

Clinical Features
- UGIB (see Upper Gastrointestinal Bleeding, G25)
- painless

Treatment
- prophylaxis with gastric acid suppressants decreases risk of UGIB; PPI most potent but may increase risk of pneumonia; H2 blockers less potent but less likely to cause pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

Gastric Carcinoma

- see General Surgery, GS19

Small and Large Bowel

Classification of Diarrhea

Definition
- clinically: diarrhea defined as stools that are looser and/or more frequent than normal (i.e. ≥3x per day); physiologically: 24 h stool weight >200 g (less useful clinically)

Classification
- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume (>1/2 cup stool; typical of small bowel diseases)
- watery: secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)
- steatorrhea
- inflammatory
- functional
**Acute Diarrhea**

**Definition**
- passage of frequent unformed stools for <14 d

**Etiology**
- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

**Risk Factors**
- food (seafood, chicken, turkey, eggs, beef)
- medications: antibiotics, laxatives
- others: high risk sexual activity, infectious outbreaks, family history (IBD)

**Table 8. Classification of Acute Diarrhea**

<td>Antibiotics unlikely to be helpful</td>
</tr>
</tbody>
</table>

**Infections**
- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (day care worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
- C&S only tests Campylobacter, Salmonella, Shigella, E. coli
- other organisms must be ordered separately
- flexible sigmoidoscopy (without bowel preparation); useful if inflammatory diarrhea suspected
- biopsies are the most useful method of distinguishing idiopathic IBD (Crohn’s disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
- C. difficile toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home, or recent chemotherapy

**Treatment**
- fluid and electrolyte replacement orally in most cases, intravenously if severe extremes of age/coma
- anti-diarrheals
  - antimotility agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
    - side effects: abdominal cramps, toxic megacolon
- absorbants: kaolin/pectin (Kapectate®), methylcellulose, activated attapulgite
  - act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
  - much less effective than antimotility agents
- modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful (but should not be used in the presence of bloody diarrhea or fever
- antibiotics: rarely indicated
  - risks
    - prolonged excretion of enteric pathogen (especially Salmonella)
    - drug side effects (including C. difficile infection)
    - development of resistant strains
    - renal failure/hemolysis (enterohemorrhagic E. coli O157:H7)

**Useful Questions in Acute Diarrhea**
- Those Fads Wilt
  - Travel
  - Homosexual contacts
  - Outbreaks
  - Seafood
  - Extra-intestinal signs of IBD
  - Family history
  - Antibiotics
  - Diet
  - Straitmote
  - Weight loss
  - Immunosuppressed
  - Laxatives
  - Tumour history

**Infectious Causes of Inflammatory Diarrhea**
- Your Stool Smells Extremely Crappy
  - Yersinia
  - Shigella
  - Salmonella
  - E. coli (EHEC O157:H7), E. histolytica
  - Campylobacter, C. difficile

**Finally: A Role for Bacteriotherapy**
- Duodenal Infusion of Donor Feces for Recurrent Clostridium difficile
- NEJM 2013; 368:407-15
- For centuries, out-of-the-box thinkers have speculated that the colonic bacteria all of us have, but which differs among individuals, play a role in disease. More recently, the colonic microbiome has become the hottest area of research in gastroenterology. The best documented medical indication for manipulating the colonic bacteria is recurrent C. difficile infection. In this randomized study of this disease, infusion of donor feces via a nasojejunal tube resolved diarrhea in 81% of patients, without side-effects, compared to 31% given the standard treatment of oral vancomycin, and 27% of patients given oral vancomycin plus bowel/usage. It takes little prescience to predict an onslaught of future studies investigating the therapeutic potential of altering the human microbiome.
- indications for antimicrobial agents in acute diarrhea
  - sepsisemia
  - prolonged fever with fecal blood or leukocytes
  - clearly indicated: *Shigella*, *V. cholerae*, *C. difficile*, traveller's diarrhea (enterotoxigenic *E. coli* [ETEC]), *Giardia, Entamoeba histolytica*, *Cyclospora*
  - situational: *Salmonella*, *Campylobacter*, *Yersinia*, non-enterotoxigenic *E. coli*
  - *Salmonella* always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

### Traveller’s Diarrhea

- see Infectious Diseases, ID13

### Chronic Diarrhea

**Definition**
- passage of frequent unformed stool for >4 wk (persistent diarrhea as 14-30 d)
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

**Etiology/Classification**
- see Differential Diagnosis of Common Presenting Complaints, G4

**Investigations**
- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

### Malabsorption and Maldigestion

**Definition**
- maldigestion: inability to break down large molecules in the lumen of the intestine into their component small molecules
- malabsorption: inability to transport molecules across the intestinal mucosa into circulation
- malassimilation: encompasses both maldigestion and malabsorption

**Etiology**
- maldigestion
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis, pancreatitis, cancer)
  - bile salt deficiency
    - terminal ileal disease (impaired recycling), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. primary biliary cirrhosis)
  - specific enzyme deficiencies (e.g. lactase)
- malabsorption
  - inadequate absorptive surface
  - infections/infestations (e.g. Whipple's disease, *Giardia*)
  - immunologic or allergic injury (e.g. celiac disease)
  - infiltration (e.g. lymphoma, amyloidosis)
  - fibrosis (e.g. systemic sclerosis, radiation enteritis)
  - bowel resection (length, site, location, presence/absence of ileocecal valve are important)
  - extensive ileal *Crohn's* disease
  - drug-induced
    - *cholestyramine*, ethanol, neomycin, tetracycline, and other antibiotics
    - endocrine
      - DM (complex pathogenesis)

**Clinical Features**
- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency
Table 9. Absorption of Nutrients and Fat Soluble Vitamins

<table>
<thead>
<tr>
<th>Deficiency</th>
<th>Absorption</th>

<td>Retinopathy, neurological problems</td>
<td></td>
</tr>
<tr>
<td>Vitamin K</td>
<td>Synthesized by intestinal flora. ↑ risk of deficiency after prolonged use of broad spectrum antibiotics and/or starvation</td>
<td>Prolonged INR may cause bleeding</td>
<td></td>
</tr>
</tbody>
</table>

* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone.

**Investigations**
- transglutaminase (tTG) antibody serology/imunoglobulin quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase (not routinely available) to screen for pancreatic insufficienty and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca^{2+}, Mg^{2+}, vitamin B_{12}, albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (rarely used)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

**Treatment**
- dependent on underlying etiology
Celiac Disease (Gluten Enteropathy/Sprue)

Definition
• abnormal small intestine mucosa due to intestinal reaction to gluten, a protein found in cereal grains

Etiology
• only autoimmune disease in which antigen (various gliadin peptides) is recognized
• associated with other autoimmune diseases, especially Sjögren’s, thyroid disease
• gluten, a protein in cereal grains, is broken down to gliadin, which is the toxic factor
• HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; celiac also associated with HLA-DQ8 (note: up to 40% of Caucasians carry the HLA alleles, but will never develop celiac disease)

Epidemiology
• more common in women
• family history: 10-15% of first-degree relatives
• may present any time from infancy (when cereals introduced) to elderly
• peak presentation in infancy

Clinical Features
• classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency
• improves with gluten-free diet, deteriorates when gluten reintroduced
• disease is usually most severe in proximal bowel
  • thus iron, calcium, and folic acid deficiency (proximal absorption) more common than vitamin B12 deficiency (absorbed in ileum)
• gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paraonia, infertility, bone fractures/metabolic bone disease

Investigations
• serological tests
  • serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  • IgA deficient patients have false-negative anti-tTG
  • therefore, measure serum IgA concomitantly (via serum quantitative protein electrophoresis)
  • incorporate serum testing tTG and/or DGP IgG in IgA deficiencies
• small bowel mucosal biopsy (usually duodenum) is diagnostic with increased intraepithelial lymphocytes (earliest pathologic finding)
  • crypt hyperplasia
  • villous atrophy
  • note: villous atrophy also seen in small bowel overgrowth, Crohn’s, lymphoma, Giardia, HIV
• improvement with a gluten-free diet, but should not be started before serological tests and biopsy
• consider CT enterography to visualize small bowel to rule out lymphoma
• evidence of malabsorption (localized or generalized)
  • steatorrhea
  • low levels of ferritin/iron saturation, Ca++, Fe, albumin, cholesterol, carotene, B12 absorption
• fecal fat >7%

Treatment
• dietary counselling
  • gluten free diet; avoid barley, rye, wheat (as these grains are related and also have toxic factor, similar to gliadin)
  • oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  • rice and corn flour are acceptable
  • iron, folate supplementation (with supplementation of other vitamins as needed)
• if poor response to diet change, consider
  • alternate diagnosis
  • non-adherence to gluten-free diet
  • concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  • development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
  • development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

Prognosis
• associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight increase compared with general population), autoimmune diseases
• risk of lymphoma may be lowered by dietary gluten restriction
Inflammatory Bowel Disease

Definition
- Crohn’s disease (CD), ulcerative colitis (UC), indeterminate colitis or IBD-unclassified (IBDU)

Pathophysiology
- poorly understood
- most likely a sustained response of the immune system, perhaps to enteric flora
- lack of appropriate down-regulation of immune responsiveness after an infection in a genetically predisposed individual

Genetics
- increased risk of both UC and CD in relatives of patients with either disease, especially siblings, early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 9 gene loci are associated
- CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially Ashkenazi Jews, early onset disease, ileal involvement, fistulizing and stenotic disease
  - CARD15 gene product modulates NFκB, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

**Crohn’s Disease**

**Definition**
- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region (“gum to bum”)

**Epidemiology**
- incidence 1-6/100,000; prevalence 10-100/100,000
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn’s increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in Crohn’s patients is higher than general population

**Pathology**
- most common location: ileum + ascending colon
- linear ulcers leading to mucosal islands and “cobblestone” appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

**Clinical Features**
- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, non-bloody diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- extra-intestinal manifestations are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

**Investigations**
- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, C. difficile toxin to exclude other causes of inflammatory diarrhea
Management (see Figure 7)

Table 12. Management of Crohn’s Disease

<td></td>
</tr>
</tbody>
</table>

5-ASA**
- Efficacy controversial: Is currently used for mild ileitis |
- Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine |
- Hydrolysis by intestinal bacteria releases 5-ASA (active component) |
- Dose-dependent efficacy |
- Mesalamine (Pentasa®): coated 5-ASA releases 5-ASA in the ileum and colon when inflammation is mild |

Antibiotics
e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin |
- Best described for perianal Crohn’s, although characteristic relapse when discontinued |

Corticosteroids
- Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe |
- No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis |

Immunosuppressives
- 6-mercaptopurine (6-MP), azathioprine (Imuran®); methotrexate (used less often) |
- More often used to maintain remission than to treat active inflammation |
- Most commonly used as steroid-sparing agents |
- i.e. to lower risk of relapse as corticosteroids are withdrawn |
- May require > 3 mo to have beneficial effect; usually continued for several years |
- May help to heal fistulae, decrease disease activity |
- Increases efficacy of biologicals plus lowers chances of biological dosing efficacy (tolerance) so often given in combination with biologics |
- Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy (i.e. lymphoma) |

Biologics
- Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α |
- Proven effective for treatment of fistulae and patients with medically refractory CD |
- First-line immunosuppressive therapy with infliximab = azathioprine more effective than using either alone |

Surgical/Experimental
- Surgical treatment (see General Surgery, GS28) |
- Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease |
- If < 50% or < 200 cm of functional small intestine, risk of short bowel syndrome |
- At least 50% cumulative recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher |
- 40% likelihood of second bowel resection, 30% likelihood of third bowel resection |
- Complications of ileal resection |
  - < 100 cm resected → watery diarrhea or cholorrhea (impaired bile salt absorption) |
  - Treatment: cholestyramine or anti-diarrheals e.g. loperamide |
  - > 100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency) |
  - Treatment: fat restriction, medium chain triglycerides |

Prognosis
- Highly variable course |
- 10% disabled by the disease eventually, spontaneous remission also described |
- Increased mortality, especially with more proximal disease, greatest in the first 4-5 yr |
- Complications include |
  - Intestinal obstruction/perforation |
  - Fistula formation |
  - Malignancy (lower risk compared to UC) |
- Surveillance colonoscopy same as ulcerative colitis (see Ulcerative Colitis) if more than 1/3 of colon involved |

Ulcerative Colitis

Definition
- Inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum |

Epidemiology
- Incidence 2-10/100,000; prevalence 35-100/100,000 (more common than Crohn’s) |
- 2/3 onset by age 30 (with second peak after 50); M=F |
- Small hereditary contribution (15% of cases have 1st degree relative with disease) |
- Risk is less in smokers |
- Inflammation limited to rectum or left colon is more common than pancolitis
Pathology
• disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
• inflammation is diffuse, continuous and confined to mucosa

Clinical Features
• rectal bleeding is the hallmark feature; diarrhea present if more than the rectum is involved
  • can also have abdominal cramps/pain, especially with defecation
• severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
• tenesmus, urgency, incontinence
• systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
• extra-intestinal manifestations (see Table 11)
• characteristic exacerbations and remissions; 5% of cases are fulminant

Investigations
• sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
• colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
• CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
• stool culture, microscopy, C. difficile toxin assay necessary to exclude infection
• no single confirmatory test

Treatment
• mainstays of treatment: 5-ASA (mesalamine) derivatives (only in mild to moderate disease) and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
• diet of little value in decreasing inflammation but may alleviate symptoms
• anti-diarrheal medications generally not indicated in UC
  • 5-ASA
    • topical (suppository or enema): effective for distal disease (rectum to splenic flexure) if inflammation is mild, preferable to corticosteroids
    • oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d)
    • commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
  • may decrease rate of colorectal cancer
  • corticosteroids
    • to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h)
    • limited role as maintenance therapy for mild to moderate disease
    • use suppositories for proctitis
    • use enemas and topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
  • immunosuppressants (steroid-sparing)
    • in hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 days; then colectomy if inadequate response
    • biologics (infliximab, adalimumab, golimumab, vedolizumab) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent
    • azathioprine and 6-mercaptopurine: too slow to rapidly resolve acute relapse
    • most commonly used to maintain remission as corticosteroids withdrawn
    • given with biologics: increase efficacy of biologics and decrease likelihood of tolerance to biologics (~ 10% chance/yr)
• surgical treatment curative
  • aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA)
  • indications: failure of adequate medical therapy; toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy

Complications
• similar to CD, except
  • more liver problems (especially PSC in men)
  • greater risk of colorectal cancer
    • risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
    • risk also increases with active mucosal inflammation and sclerosing cholangitis
  • thus, regular colonoscopy and biopsy in pancolitis of ≥8 yr is indicated
  • toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see General Surgery, GS37)

When Considering Complications of IBD, Think:

ULCERATIVE COLITIS
Urinary calculi
Liver problems
Cholelithiasis
Epithelial problems
Retardation of growth/sexual maturation
Arthralgias
Thrombophlebitis
Iatrogenic complications
Vitamin deficiencies
Eyes
Colorectal cancer
Obstruction
Leakage (perforation)
Iron deficiency
Toxic megacolon
Inanition (wasting)
Strictures
Prognosis
• chronic relapsing pattern in most patients
• 10-15% chronic continuous pattern
• >1 attack in almost all patients
• more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
• colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
• normal life expectancy
• if proctitis only, usually benign course
• stool calprotectin increasingly recognized as a marker of bowel mucosal inflammation, reported especially to be useful in monitoring the activity of inflammatory bowel disease, but still accuracy is still controversial

Irritable Bowel Syndrome

Definition
• a form of functional bowel disease; more than just a label for GI symptoms unexplained after normal investigations

Epidemiology
• 20% of North Americans
• onset of symptoms usually in young adulthood
• F>M

Pathophysiology
• associated with either abnormal perception of intestinal activity or abnormal intestinal motility
• abnormal motility: multiple abnormalities described; unclear if associations or if causative
• psychological: stress may increase IBS symptoms but probably does not cause IBS
• types of IBS: IBS with diarrhea, IBS with constipation, IBS-mixed type (both diarrhea and constipation), and IBS untyped (insufficient abnormality in stool consistency to meet other types)

Diagnosis

Table 13. Rome III Criteria for Diagnosing Irritable Bowel Syndrome

<table>
<thead>
<tr>
<th>IBS Rome III Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>≥12 wk in the past 12 mo of abdominal discomfort plus pain that has 2 out of 3 features</td>
</tr>
<tr>
<td>Relieved with defecation</td>
</tr>
<tr>
<td>Associated with a change in frequency of stool</td>
</tr>
<tr>
<td>Associated with a change in consistency of stool</td>
</tr>
</tbody>
</table>

The following are supportive, but not essential to the diagnosis:
- Abnormal stool frequency (>3/d or <3/wk)
- Abnormal stool form (lumpy/hard/loose/watery) >1/4 of defecations
- Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) >1/4 of defecations
- Passage of mucus >1/4 of defecations
- Bloating

Diagnosis of IBS Less Likely in Presence of "Red Flag" Features

<table>
<thead>
<tr>
<th>Weight loss</th>
<th>Anemia</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fever</td>
<td>Blood or pus in stool</td>
</tr>
<tr>
<td>Nocturnal defecation</td>
<td>Abnormal gross findings on flexible sigmoidoscopy</td>
</tr>
</tbody>
</table>

Normal Physical Exam

Investigations
• if history consistent with Rome III criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
• aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
• investigations can be limited to CBC, inflammatory markers (ESR, CRP) and celiac serology
• if available, fecal calprotectin is likely more reliable test to rule out IBD
• consider TSH, stool cultures depending on clinical circumstances
• consider colonoscopy (e.g. if alarming features present, family history of IBD or age > 50)

Treatment
• reassurance, explanation, support, aim for realistic goals
• relaxation therapy, biofeedback, hypnosis, stress reduction, probably exercise
• low FODMAP diet for pain, bloating gas, irregular bowel movements
• no therapeutic agent consistently effective, pain most difficult to control, no drug changes natural history so the drug should be “wanted, since it is not needed”
• symptom-guided treatment
  ■ pain predominant
    ▪ antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine - low level evidence)
    ▪ increase dietary fibre (bran or psyllium)
    ▪ tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI - moderate level of evidence)
  ■ IBS with diarrhea (IBS-D)
    ▪ increase dietary fibre (bran or psyllium) to increase stool consistency but worsens abdominal gas
    ▪ loperamide (Imodium®)
    ▪ diphenoxylate (Lomotil®)
    ▪ cholestyramine
  ■ IBS with constipation (IBS-C)
    ▪ increase fibre in diet
    ▪ linaclootide
    ▪ osmotic or other laxatives (help more with the constipation than the pain)
    ▪ mixed (alternating constipation and diarrhea) (IBS-M)

Prognosis
• 80% improve over time
• most have intermittent episodes
• normal life expectancy

**Constipation**

**Definition**
• passage of infrequent or hard stools with straining (stool water <50 mL/d); bowel frequency <3x/wk

**Epidemiology**
• increasing prevalence with age; F>M
• rare in Africa and India where stool weight is 3-4x greater than in Western countries

**Etiology**
• most common: idiopathic attributed to colon dysmotility but this is difficult to measure
• organic causes
  ▪ medication side effects (narcotics, antidepressants) are the most common
  ▪ intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
• metabolic
  ▪ DM
  ▪ hypothyroidism
  ▪ hypercalcemia, hypokalemia, uremia
• neurological
  ▪ intestinal pseudo-obstruction
  ▪ Parkinson’s disease
  ▪ MS
• collagen vascular disease (e.g. scleroderma)
• painful anal conditions (e.g. fissures)

**Clinical Presentation**
• overlaps with IBS
• stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3x/wk)

**Investigations**
• underlying disease rarely found if constipation is the only presenting symptom
  ▪ only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, and glucose, X-ray of abdomen
  ▪ colon visualization if concomitant symptoms such as rectal bleeding, weight loss, or anemia (colonoscopy, CT colonography)
• if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque markers that are ingested and followed with a series of plain film abdominal x-rays (normal: 70 h)
  1. normal = misperception of normal defecation (IBS)
  2. prolonged throughout = “colonic inertia” (infrequent bowel movements with gas/bloating, tends to occur in youth)
  3. outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
• combination of 1 and 3 common
Treatment (in order of Increasing Potency)

- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
  - docusate salts, mineral oils
- osmotic agents (effective in 2-3 d)
  - lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol
  - (β-galactosido-sorbitol), polyethylene glycol 3350
- cathartics/stimulants (effective in 24 h)
  - castor oil, senna (avoid prolonged use to prevent melanosis coli), bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (prucalopride)
- linaclotide (increases water secretion into the intestinal lumen)

Upper Gastrointestinal Bleeding

Definition

- bleeding proximal to the ligament of Treitz, see Gastrointestinal Tract, G2 (75% of GI bleeds)
  - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

Etiology

- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (see Peptic Ulcer Disease, G11)
  - erosive gastritis (e.g. from EtOH or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and CTD)
  - Dieulafoy’s lesion (very rare)
- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar)
  - coagulopathy (drugs, renal disease, liver disease)
  - vascular malformation (Dieulafoy’s lesion, AVM)

Clinical Features

- in order of decreasing severity of the bleed: hematochezia (brisk upper GI bleed) > hematemesis > coffee ground emesis > melena > occult blood in stool

Treatment

- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider NG tube to determine upper vs. lower GI bleeding in some cases
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octrreotide 50 µg loading dose followed by constant infusion of 30 µg/h
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclips
  - hemoarset

Prognosis

- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding (Forrest classification): spur or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no high risk predictors of rebleeding
- H2-antagonists should not be used since they impact minimally on rebleeding rates and need for surgery
- esophageal varices have a high rebleeding rate (55%) and mortality (25%)

Lancet 1974;2:394-397
Esophageal Varices

**Etiology**
- almost always due to portal hypertension

**Clinical Features**
- characteristically massive upper GI bleeding

**Prognosis**
- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

**Investigations**
- endoscopy

**Management**

1. Assess hemodynamic stability and resuscitate*
2. IV octreotide
   - Causes splanchnic vasoconstriction
   - Decreases portal collateral circulation and pressure
3. Endoscopic therapy: variceal ligation (EVL) or sclerotherapy

*IV ceftriaxone lowers risk of sepsis, especially spontaneous bacterial peritonitis

If varices isolated to stomach, think of splenic vein thrombosis

Gastric varices best treated by endoscopic injection of cyanoacetate (“crazy glue”)

Mallory-Weiss Tear

**Definition**
- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

**Etiology**
- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present

**Clinical Features**
- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

**Management**
- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair
Lower Gastrointestinal Bleeding

**Definition**
- bleed distal to ligament of Treitz

**Etiology**
- if blood per rectum with hemodynamic instability, rule out upper GI source
- diverticular (60% from right colon)
- vascular
  - angiodysplasia (small vascular malformations of the gut)
  - anorectal (hemorrhoids, fissures)
- neoplasm
  - cancer
  - polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic)
  - post-polypectomy

**Clinical Features**
- hematochezia (see Figure 10)
- anemia
- occult blood in stool
- rarely melena

**Treatment**
- treat underlying cause

<td>Serum Direct Bilirubin*</td>
<td>Hepatic excretion from hepatocyte to biliary system</td>
<td>Liver dysfunction</td>
<td>Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction</td>
</tr>
</tbody>
</table>

*Serum Bilirubin
*canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut
*direct bilirubin = conjugated; indirect = unconjugated bilirubin

B. Tests of Liver Injury

- disproportionately increased AST or ALT = hepatocellular damage
  - ALT more specific to liver; AST from multiple sources (especially muscle)
  - elevation of both highly suggestive of liver injury
  - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP (and GGT) = cholestasis (stasis of bile flow)
  - if ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT
  - if ALP elevation out of proportion to ALT/AST elevation, consider
    1. obstruction of common bile duct (e.g. extraluminal = pancreatic Ca, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
    2. destruction of microscopic ducts (e.g. PBC)
    3. bile acid transporter defects (e.g. drugs, intrahepatic cholestasis of pregnancy)
    4. infiltration of the liver (e.g. liver metastases, lymphoma, granulomas, amyloid)

Acute Viral Hepatitis (General)

Definition
- viral hepatitis lasting <6 mo

Clinical Features
- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - nausea/vomiting, anorexia, headaches, fatigue, myalgia, low-grade fever, arthralgia and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

Investigations
- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly the IgM antibody directed to the virus

Treatment
- supportive (hydration, diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with entecavir should be considered; in anicteric hepatitis C, anti-viral treatment should be considered (see hepatitis C)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

Prognosis
- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia
Complications
- cholestasis (most commonly associated with HAV infection)
- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

**Hepatitis A Virus**

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice
- can cause acute liver failure and subsequent death (<1-5%)
- can relapse (rarely), but never becomes chronic

**Hepatitis B Virus**

Figure 11. Time course of acute hepatitis B infection

**Epidemiology**
- 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  1. **immune tolerance**: extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or ‘incubation period’ in adult with newly-acquired HBV)
  2. **immune clearance** (or immunoactive): HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment
  3. **immune control**: lower HBV-DNA (<20,000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  4. **immune escape** ("core or precore mutant"): elevated HBV-DNA (>2,000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

**DDx for Hepatitis**
- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

**Causes of Elevated Serum Transaminases in Chronic Hepatitis B**
- Ongoing immune-mediated liver injury without immune control of HBV (HBsAg positive)
- Immune escape (anti-HBe positive)
- Reactivation, seroconversion (conversion from anti-HBe to HBeAg)
- Hepatitis D
- Hepatocellular carcinoma
- Other liver insult (lathy liver, alcohol, drugs, hepatitis A)

**Risk Factors for Progression**
- EtOH
- HIV coinfection
- Old age at diagnosis

In acute hepatitis B, HDV coinfection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis

Without treatment, 8-20% of those with ongoing immunooactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury

Risk of hepatocellular carcinoma in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis, and serum HBV-DNA

Risk of hepatocellular carcinoma in HCV increases only after cirrhosis develops

HCV (and HBV) treatment lowers the risk of hepatocellular carcinoma
**Hepatitis D**
- Defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than hepatitis B virus alone
- Coinfection: acquire HDV and HBV at the same time
- HDV can present as ALF and/or accelerate progression to cirrhosis
- Treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

**Hepatitis C Virus**
- RNA virus (7 genotypes; genotype 1 is most common in North America)
- Blood-borne transmission; sexual transmission is “inefficient”
- Major risk factor: injection drug use
- Other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- Clinical manifestation develops 6-8 wk after exposure
  - Symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

**Diagnosis**
- Suspected on basis of elevated ALT/AST and positive serum anti-HCV
- Diagnosis established by detectable HCV-RNA in serum
- Virus genotype correlates with response to treatment but not prognosis
  - Serum HCV-RNA inversely correlates with response to treatment
- Normal transaminases can have underlying cirrhosis on biopsy, but otherwise excellent prognosis

**Treatment**
- Blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid alcohol
- Clearest indication for treatment is in subgroup likely to develop clinically significant liver disease
- Persistently elevated transaminases, liver biopsy shows fibrosis/cirrhosis and at least moderately severe necrosis/inflammation
- Treatment depends on genotype
- Oral interferon-free regimens (e.g. sofosbuvir/ledipasvir, ombitasvir/paritaprevir/ritonavir+dasabuvir, or elbasvir/grazoprevir) are now becoming the standard of care with >90% success rate without significant side-effects including those who failed previous interferon-based treatment

**Prognosis**
- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- Risk of hepatocellular carcinoma increases if cirrhotic
- Can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

</tbody>
</table>

Autoimmune Chronic Active Hepatitis

- diagnosis of exclusion: rule out viruses, drugs, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud’s, thyroiditis, Sjögren’s, arthralgias
  - hypergammaglobulinemia
    - anti-smooth muscle antibody elevation is most characteristic; also elevations in anti-LKM elevation (liver kidney microsome), especially in children
    - less specific: elevated ANA, RF
  - can have false positive viral serology (especially anti-HCV)
  - biopsy – perportal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)
**Drug-Induced Liver Disease**

### Specific Drugs
- aceterminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause ALF (transaminases >1,000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high aceterminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite is formed → covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: N/V (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
    - note: potential delay in presentation in sustained-release products
  - blood levels of aceterminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emasition (if <2 h after ingestion)
    - oral activated charcoal
    - N-acetylcysteine (NAC, Mucomyst*) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
      - promotes hepatic glutathione regeneration
      - no recorded fatal outcomes if NAC given before increase in transaminases
    - chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
    - INH (isoniazid)
      - 20% develop elevated transaminases but <1% develop clinically significant disease
      - susceptibility to injury increases with age
    - methotrexate
      - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
      - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
    - amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
    - others: azoles, statins, methylprednisolone, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
    - herbs: chaparrel, Chinese herbs (e.g. germander, comfrey, bush tea)

### Wilson’s Disease

**Definition**
- autosomal recessive defect in copper metabolism (gene ATP7B)

**Etiology**
- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin

**Clinical Features**
- liver: acute hepatitis, acute liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
- eyes: Kayser-Fleischer rings (copper deposits in Descemet’s membrane); more common in patients with CNS involvement, present in 50% if only liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi’s syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

**Investigations**
- suspect if increased liver enzymes with clinical manifestations at young age (<30); especially combination of liver disease with dystonia, psychiatric symptoms
Hemochromatosis

Definition
- Excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20–40 g (normal 1 g).

Etiology
- Primary (hereditary) hemochromatosis
  - Hepcidin deficiency results in ongoing gut absorption of iron despite adequate iron stores.
- Secondary hemochromatosis
  - Parenteral iron overload (e.g., transfusions).
  - Chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency.
  - Excessive iron intake.

Epidemiology
- Hereditary hemochromatosis most common in Northern European descent.
- Primarily due to common recessive gene (HFE, 5%); 1/400 patients are homozygotes.

Clinical Features
- Usually presents with trivial elevation in serum transaminases.
- Liver: cirrhosis (30%), HCC (200x increased risk) – most common cause of death (1/3 of patients).
- Pancreas: DM, chronic pancreatitis.
- Skin: bronze or grey (due to melanin, not iron).
- Joint: arthralgia (any joint, but especially MCP joints), chondrocalcinosis.

Investigations
- Screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease).
  - Transferrin saturation (free Fe²⁺/TIBC) >45%.
  - Serum ferritin >400 ng/mL.
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened.
- Liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease).
  - Markers of advanced fibrosis: if any of the following are present at the time of diagnosis – age >40, elevated liver enzymes, or ferritin >1000.
  - Considered if compound heterozygote and potential other cause of liver injury (e.g., fatty liver, etc.).
  - If C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed.
- HCC screening if cirrhosis.

Treatment
- Phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo.
- Detreraxamines if phlebotomy contraindicated (e.g., cardiomyopathy, anemia).
- Primary hemochromatosis responds well to phlebotomy.
- Secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted).

Prognosis
- Normal life expectancy if treated before the development of cirrhosis or DM.
Alcoholic Liver Disease

Definition
- fatty liver (all alcoholics): always reversible if alcohol stopped
- alcoholic hepatitis (35% of alcoholics): usually reversible if alcohol stopped
- cirrhosis (10-15% of alcoholics): potentially irreversible

Pathophysiology
- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
  - reduces NAD to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
- binds to hepatocytes evoking an immune reaction
- ethanol increases gut permeability leading to increased bacterial translocation
- alcohol metabolism causes
  - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

Clinical Features
- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver
  - mildly tender hepatomegaly; jaundice rare
  - mildly increased transaminases <5x normal
- alcoholic hepatitis
  - variable severity: mild to fatal liver failure
  - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mildly jaundice, and mildly elevated INR)
  - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

Investigations
- blood tests are non-specific, but in general
  - AST/ALT >2:1 (both usually <300)
  - if ALT>AST, usually cirrhosis has developed (assuming alcohol in the cause of the liver disease)
  - CBC: increased MCV, increased WBC

Treatment
- alcohol cessation (see Psychiatry, PS23)
  - Alcohols Anonymous, disulfiram, naltrexone, acamprosate
  - multivitamin supplements (especially thiamine)
  - caution with drugs metabolized by the liver
  - prednisone and pentoxifylline less used since most definitive trial did not show efficacy

Prognosis
- Maddrey's discriminant function (based on PT and bilirubin) and MELD predict mortality and guide treatment
- fatty liver: complete resolution with cessation of alcohol intake
- alcoholic hepatitis mortality
  - immediate: 30%-60% in the first 6 mo if severe
  - with continued alcohol: 70% in 5 yr
  - with cessation: 30% in 5 yr

Non-Alcoholic Fatty Liver Disease

Definition
- spectrum of disorders characterized by macrovesicular hepatic steatosis, sometimes with inflammation and/or fibrosis
- most common cause of liver disease in North America
Etiology
• pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
• histological changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

Risk Factors
• likely a component of the metabolic syndrome along with type 2 DM, HTN, hypertriglyceridemia
• rapid weight loss or weight gain

Clinical Features
• often asymptomatic
• may present with fatigue, malaise, and vague RUQ discomfort
• elevated serum triglyceride/cholesterol levels and insulin resistance

Investigations
• elevated serum AST, ALT ± ALP; AST/ALT <1
• presents as echogenic liver texture on ultrasound
• liver biopsy diagnostic, but often necessary only for prognosis

Treatment
• mainstay is gradual weight loss (0.5-1 kg/wk) as rapid weight loss can worsen liver disease
  • ideally, aim to lose at least 7-10% of body weight
• some evidence for vitamin E (800 U daily) if there is hepatic inflammation
• some evidence for benefits of coffee drinking (3 cups per day) and vitamin D

Prognosis
• most die from cardiovascular or cerebrovascular disease
• better prognosis than alcoholic hepatitis
  • <25% progress to cirrhosis over a 7-10 yr period
• risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
• other clinical indicators of unfavourable prognosis: DM, age, metabolic syndrome

Acute Liver Failure (formerly Fulminant Hepatic Failure)

Definition
• severe decline in liver function characterized by coagulation abnormality (INR>1.5) and encephalopathy
• in setting of previously normal liver
• rapid (<26 wk duration)

Etiology
• drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

Treatment
• correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, monitor for infection and multiorgan failure (usually requires ICU)
• consider liver biopsy before INR becomes too high
• chief value of biopsy is to exclude chronic disease, less helpful for prognosis
• liver transplant (King’s College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), age <10 or >40, cause is drug or unknown, bilirubin >300 µmol/L, INR >3.5, creatinine >200 µmol/L

Cirrhosis

Definition
• liver damage characterized by diffuse distortion of the basic architecture and replacement with scar tissue and formation of regenerative nodules
• Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
• Stage 2 cirrhosis is decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy, characteristically presents abruptly even though histologically the liver fibrosis is gradually progressive

Etiology
• fatty liver (alcoholic or non-alcoholic fatty liver disease)
• chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- hemochromatosis
- primary biliary cirrhosis
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
  - cryptogenic (i.e., no identifiable cause, although many of these patients may represent “burnt-out NASH”)
- rare: Wilson’s disease, Gaucher’s disease, α1-antitrypsin deficiency

**Investigations**
- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work: fall in platelet count <150 is the earliest finding, followed many years later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event)
  - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - U/S is the primary imaging modality but only finds advanced cirrhosis
    - CT to look for varices, nodular liver texture, splenomegaly, ascites
    - Ultrasound elastography (FibroScan): non-invasive tool using elastography (variable availability)
  - gastroscopy: varices or portal gastropathy

**Treatment**
- treat underlying disorder
- decrease insults (e.g., alcohol cessation, hepatotoxic drugs, immunize for Hep A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh score and MELD score
- liver transplantation for end-stage disease if no alcohol for >6 mo; use MELD score

**Table 18. Child-Pugh Score and Interpretation**

Score: 5-6 (Child’s A), 7-9 (Child’s B), 10-15 (Child’s C)

*Note: Child’s classification is rarely used for shunting (TIPS or other surgical shunts), but is still useful to quantitate the severity of cirrhosis

**Complications**
- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
  - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%
  - hepatic venous pressure gradient (HVPG) ≥10 mmHg is the strongest predictor of variceal development
  - treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g., octreotide IV) combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
  - classifications
    - pre-renal (usually due to over-diuresis)
    - acute tubular necrosis
    - HRS
      - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - Type II: gradual increase in creatinine with worsening liver function (creatine doubling over years)

**MELD-Na (Model for End Stage Liver Disease)**
- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, total bilirubin, and serum sodium concentration

**Liver Transplantation**
- Candidate for transplant
- Priorities: MELD score
- Liver allocation based on MELD score and transplant waiting time

**Liver Transplant**
- Operative mortality: 10%
- 1-3 mo: 30%
- 15-50 yr: 10%

**Cirrhosis Complications**

- **Varices**
  - Acute Hemorrhage
  - Portal Hypertension
- **Ascites/Anemia**
- **Renal Failure** (hepatorenal syndrome)
- **Coagulopathy**
- **Encephalopathy**
- **Sepsis**

**Usual causes of death in cirrhosis:**
- Renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

**Hepatorenal Syndrome vs. Pre-Renal Failure – Difficult to Differentiate**
- Similar blood and urine findings
- Urine sodium: very low in hepatorenal; low in pre-renal
- Intravenous fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome
HRS can occur at any time in severe liver disease, especially after
- overdiuresis or dehydration, such as diarrhea, vomiting, etc.
- GI bleed
- sepsis
- treatment for hepatorenal syndrome (generally unsuccessful at improving long-term survival)
  - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
  - definitive treatment is liver transplant

hepatopulmonary syndrome
- majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal HTN
- thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
- clinical features
  - hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
  - dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
  - diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
  - only proven treatment is liver transplantation

Effects of Liver Failure
- Encephalopathy (coma)
- Xanthelasma
- Scleral icterus
- jaundice
- Fétor hepaticus
- Spider angioma
- Gynecomastia
- Muscle wasting
- Bleeding tendency (bruising)
- Loss of sexual hair, testicular atrophy
- Ankle edema
- Palmar erythema
- Dupuytren’s contracture, asterixis anemia
- Leukonychia, Terry’s nails, clubbing

Figure 13. Clinical features of liver disease

Hepatocellular Carcinoma
- see General Surgery, GS44

Liver Transplantation
- see General Surgery, GS45

Portal Hypertension

Definition
- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

Pathophysiology
- 3 sites of increased resistance (remember pressure = flow x resistance)
  - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

Complications
- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

Fibrosis may regress and disappear if cause of liver injury is treated or resolves

Hepatopulmonary Syndrome
- Clinical Triad
  - Liver disease
  - Increased alveolar-arterial gradient while breathing room air
  - Evidence for intrapulmonary vascular abnormalities

© Jason Sharpe 2003
Treatment
- non-selective β-blockers (propanolol, nadolol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
  - radiologically inserted stent between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
- shunt usually remains open for <1 yr
- complications: hepatic encephalopathy, deterioration of hepatic function
- contraindicated with severe liver dysfunction
- most commonly used as a “bridge” to liver transplant
- other surgically created shunts: portacaval, distal spleno-renal (Warren shunt) - all used only rarely in the modern era

**Hepatic Encephalopathy**

Definition
- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

Pathophysiology
- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

Precipitating Factors
- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

Stages
- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness, disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar response (upgoing Babinski)
- IV: coma (response to painful stimuli only)

Investigations
- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves
- serum ammonia levels increased, but not often necessary to measure in routine clinical use

Treatment
- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - routine protein restriction is no longer recommended given patients generally have concurrent malnutrition and muscle wasting; however, vegetable protein is better tolerated than animal protein
  - lactulose: titrated to achieve 2-3 soft stools/d
    - prevents diffusion of NH3 (ammonia) from the colon into blood by lowering pH and forming non-diffusible NH4 ( ammonium)
    - serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - also acts as a laxative to eliminate nitrogen-producing bacteria from colon
- oral rifaximin for both acute treatment and maintenance therapy has high level evidence for efficacy
- best acute treatment in comatose patient is lactulose enemas
- other antibiotics that may be used include metronidazole and vancomycin
Ascites

Definition
• accumulation of excess fluid in the peritoneal cavity

Etiology
Table 19. Serum-Ascites Albumin Gradient as an Indicator of the Causes of Ascites

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Pathophysiology
• key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  ■ underfill hypothesis: first step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney
  ■ overfill hypothesis: cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily
  ■ peripheral arterial vasodilation theory (most popular): as portal HTN develops in cirrhosis, production of local mediators such as nitric oxide lead to splanchnic arterial vasodilation which ultimately results in reduction of effective arterial volume and compensatory sodium and fluid retention by the kidneys (i.e. circulation volume is increased, as per overfill hypothesis, but relatively underfilled, as per underfill hypothesis)

Diagnosis
• abdominal ultrasound
• physical exam (clinically detectable when >500 mL)
  ■ bulging flanks, shifting dullness, fluid-wave test positive
  ■ most sensitive symptom: ankle swelling

Investigations
• diagnostic paracentesis
  ■ 1st aliquot: cell count and differential
  ■ 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chyloous ascites)
  ■ 3rd aliquot: C&S, Gram stain
  ■ 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

Treatment
• non-refractory ascites
  ■ Na⁺ restriction (daily sodium intake <2 g)
  ■ diuretics: spironolactone, furosemide
  ■ aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  ■ if target weight loss is not achieved and there are no complications, increase dose to achieve target while monitoring for complications

• refractory ascites (diuretics are inadequate or not tolerated)
  ■ therapeutic paracentesis with intravenous albumin
  ■ TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
  ■ liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis is associated with 50% 2 yr mortality
Complication: Primary/Spontaneous Bacterial Peritonitis

- primary/spontaneous bacterial peritonitis (SBP)
  - complications: ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: E. coli (most common), Streptococcus, Klebsiella

- diagnosis
  - absolute neutrophil count in peritoneal fluid >0.25x10^9 cells/L (250 cells/mm^3)
  - Gram stain positive in only 10-50% of patients (not needed for diagnosis)
  - culture positive in <80% of patients

- prophylaxis: consider in patients with
  - cirrhosis or GI bleed: ceftriaxone IV daily or norfloxacine bid x 7 d
  - previous episode of SBP: long-term prophylaxis with daily norfloxacine or TMP-SMX

- treatment
  - IV antibiotics (cefotaxime 2 g IV q8h or ceftriaxone 2g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
  - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

Biliary Tract

Jaundice

- see Table 2 and Figures 15 and 16

Signs and Symptoms

- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer, although most patients with pancreatic cancer have pain
- keratitis: rarely seen in adults due to maturation of blood brain barrier

Investigations

- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- direct bile duct visualization
- magnetic resonance cholangiopancreatography (MRCP): non-invasive
- endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumours
- endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
- percutaneous transhepatic cholangiography (PTC): if ERCP fails (endoscopic access not possible)
**Gilbert’s Syndrome**

**Definition**
- mild decrease in glucuronyltransferase activity leading to defective conjugation of bilirubin
- an abnormality of bilirubin metabolism with no clinical relevance

**Etiology/Epidemiology**
- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

**Clinical Features**
- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

**Treatment**
- none indicated (entirely benign)

---

**Primary Sclerosing Cholangitis**

**Definition**
- narrowing of biliary tree (intra and/or extrahepatic bile ducts) from scarring

**Etiology**
- primary/idiopathic (most common)
  - associated with IBD, more commonly UC, in up to 70% of patients (usually male)
  - one of the most common indications for liver transplant
- secondary (less common)
  - long-term cholelithiasis
  - cholangiocarcinoma
  - surgical/traumatic injury (iatrogenic)
  - contiguous inflammatory process
  - post-ERCP
  - associated with HIV/AIDS (“HIV cholangiopathy”)
  - IgG4-related disease

**Signs and Symptoms**
- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

**Investigations**
- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)
- MRCP and ERCP shows narrowing and dilatations of bile ducts that may result in “beading”, both intrahepatic and extrahepatic bile ducts
  - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

**Complications**
- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

**Treatment**
- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
- endoscopic sphincterotomy; biliary stent in selected cases of dominant CBD stricture
- antibiotics for cholangitis
- suppurrative cholangitis requires emergency drainage of pus in CBD
- liver transplantation appears to be the best treatment for advanced sclerosing cholangitis (nearly 90% 1-yr survival; mean follow-up from time of diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

**Prognosis**
- unfavourable regardless of treatment
- mean survival after diagnosis remains 4-10 yr
Primary Biliary Cholangitis (formerly cirrhosis)

Definition
• chronic inflammation and fibrous obliteration of intrahepatic bile ductules

Etiology/Epidemiology
• likely autoimmune (associated with Sjögren’s syndrome, scleroderma, CREST syndrome, RA, thyroiditis)
• affects mainly middle-aged women (M:F = 1:9)

Signs and Symptoms
• often asymptomatic
• initial symptoms: pruritus, fatigue
• chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
• end-stage: hepatocellular failure, portal HTN, ascites
• high incidence of osteoporosis

Investigations
• increased ALP, GGT; bilirubin rises in later stage
• positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
• increased serum cholesterol (mild increase in LDL, larger increase in HDL)
  • may have: xanthelasmas, xanthomas
• liver biopsy confirms diagnosis and stages severity
• normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
• recently described “overlap” syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis

Treatment
• treat with ursodiol (less frequently colchicine, methotrexate)
• cholestyramine (for pruritus and hypercholesterolemia)
• calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
• monitor for thyroid disease
• liver transplant if disease severe, progressive

Prognosis
• can be fatal, although not all asymptomatic patients show progression

Secondary Biliary Cirrhosis

Definition
• cirrhosis from prolonged partial or total obstruction of major bile ducts

Etiology
• acquired: post-operative strictures, chronic pancreatitis, sclerosing cholangitis, stone in bile duct
• congenital: CF, congenital biliary atresia, choledochal cysts

Investigations
• cholangiography and liver biopsy

Treatment
• treat obstruction, give antibiotics for cholangitis prophylaxis

Biliary Colic, Cholecystitis

• see General Surgery, GS47
Ascending Cholangitis

• see General Surgery, GS49

Definition
• infection of the biliary tree

Etiology
• stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
• infection originates in the duodenum or spreads hematogenously from the portal vein
• bacteria
  ▪ E. coli, Klebsiella, Enterobacter, Enterococcus
  ▪ co-infection with Bacteroides and Clostridia can occur

Signs and Symptoms
• Charcot's triad: fever, RUQ pain, jaundice (50-70%)
• Reynolds' Pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

Investigations
• increased WBC
• usually increased ALP and bilirubin, ALT variably elevated
• blood culture
• abdominal U/S: CBD dilation, stones

Treatment
• most important is drainage, ideally via ERCP, but if not possible technically by percutaneous biliary or least often by surgical routes
• antibiotic therapy: broad spectrum to cover Gram-negatives, Enterococcus, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  ▪ ampicillin + sulbactam or piperacillin/tazobactam
  ▪ metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  ▪ carbapenem monotherapy (e.g. imipenem or meropenem)

Prognosis
• good with effective drainage and antibiotics in mild to moderate cases
• high mortality (~50%) in patients with Reynolds Pentad

Pancreas

Pancreatic Enzyme Abnormalities

Causes of Increased Serum Amylase
• pancreatic disease
  ▪ pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
• non-pancreatic abdominal disease
  ▪ biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
• non-abdominal disease
  ▪ cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  ▪ macroamylasemia

Causes of Increased Serum Lipase
• pancreatic disease: same as above
• non-pancreatic abdominal disease (mild elevations only): same as above
• non-abdominal disease
  ▪ macrolipasemia
  ▪ renal failure
**Acute Pancreatitis**

**Etiology** (most common are alcohol and gallstones)

- **Idiopathic:** thought to be hypertensive sphincter or microlithiasis
- **Gallstones** (45%)
- **Ethanol** (35%)
- **Tumours:** pancreas, ampulla, choledochocoele
- **Scorpion stings**

**Microbiological**
- **bacterial:** Mycoplasma, Campylobacter, TB, M. avium intracellulare, Legionella, leptospirosis
- **viral:** mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
- **parasites:** ascaris, clonorchiasis, echinococcus

**Autoimmune:** SLE, polyarteritis nodosa (PAN), Crohn’s disease

**Surgery/trauma**
- manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer

**Hyperlipidemia** (TG >11.3 mmol/L; >1000 mg/dL), **Hypercalcemia, Hypothermia**

**Emboli or ischemia**

**Drugs/toxins**
- azathioprine, mercaptopurine, furosemide, estrogens, methyl dopa, H₂-blockers, valproic acid, antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

**Pathophysiology**

- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- in ethanol-related pancreatitis, pathogenesis is unknown
- in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

**Pathology**

- mild (interstitial)
  - peri-pancreatic fat necrosis
  - interstitial edema
- severe (necrotic)
  - extensive peri-pancreatic and intra-pancreatic fat necrosis
  - parenchymal necrosis and hemorrhage → infection in 60%
  - release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
  - severity of clinical features may not always correlate with pathology
- 3 phases
  - local inflammation + necrosis → hypovolemia
  - systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
  - local complications 2 wk after presentation → pancreatic sepsis/abscess

**Signs and Symptoms**

- pain: epigastric, noncolicky, constant
- can radiate to back
- may improve when leaning forward (Inglefinger’s sign)
- tender rigid abdomen; guarding
- N/V
- abdominal distention from paralytic ileus
- fever: chemical, not due to infection
- jaundice: compression or obstruction of bile duct
- Cullen’s/Grey-Turner’s signs
- tetany: transient hypocalcemia
- hypovolemic shock: can lead to renal failure
- acute respiratory distress syndrome
- coma

**Investigations**

- increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- increased WBC, glucose, low calcium
- imaging: CT most useful for diagnosis and prognosis
  - x-ray: “sentinel loop” (dilated proximal jejunum), calcification, and “colon cut-off sign” (colonic spasm)
  - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  - CT scan with IV contrast (67% sensitivity, 100% specificity)
  - CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
  - ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum
Classification
- interstitial edematous vs. necrotizing
- mild, moderate, severe

Prognosis
- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to
  - shock
  - pulmonary edema
  - multi-organ dysfunction syndrome
  - GI ulceration due to stress
  - death
- numerous scales to describe severity; probably most useful is proportion of pancreas not taking up contrast on CT done 48 hours after presentation (necrotic pancreas does not take up the contrast dye)
- presence of organ failure, particularly organ failure that persists > 48 hours, is associated with worse outcomes

Table 21. Collections in pancreatitis (Revised 2012 Atlanta Classification)

<table>
<thead>
<tr>
<th></th>
<th>Liquid</th>
<th>Solid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acute</td>
<td>Acute peripancreatic fluid collection (APFC)</td>
<td>Acute necrotic collection (ANC)</td>
</tr>
<tr>
<td>Chronic</td>
<td>Pancreatic pseudocyst</td>
<td>Walled-off necrosis (WON)</td>
</tr>
</tbody>
</table>

All of these collections are classified as infected or not infected

Treatment
- goals (only supportive therapy available)
  1. hemodynamic stability
  2. analgesia
  3. oxygen
  4. stop progression of damage (difficult)
  5. treat local and systemic complications
- antibiotics controversial except in documented infection (use cephalosporins, imipenem)
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
  - beware third spacing of fluid, monitor urine output carefully
- NG suction (lets pancreas rest) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
  - recent evidence supports nasogastric enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H2–blockers, peritoneal lavage
- follow clinically and CT/ultrasound to exclude complications
- chief role of invasive intervention is to excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for >2 wk to allow demarcation between viable and necrotic tissue), better done endoscopically or radiologically than surgically if technically possible

Late Complications
- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
  - drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
  - bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: DM, pancreatic duct damage

Chronic Pancreatitis

Definition
- irreversible damage to pancreas characterized by
  1. pancreatic cell loss (from necrosis)
  2. inflammation
  3. fibrosis

Etiology/Pathophysiology
- alcohol (most common)
  - causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  - changes composition of pancreatic juice (e.g. increases viscosity)

Etiology
- alcohol abstinence
- Pancreatic enzyme replacement
- Analgesics
- Pancreatic resection if ductular blockage

Etiology = Almost Always Alcohol
• decreases pancreatic secretion of pancreatic stone protein (lithostathine) which normally solubilizes calcium salts
  • precipitation of calcium within pancreatic duct results in duct and gland destruction
• toxic effect on acinar and duct cells – directly or via increasing free radicals
• acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
• varying degrees of ductular dilatation, strictures, protein plugs, calcification
• no satisfactory theory to explain why only a minority of alcoholics develop pancreatitis
• unusual causes
  • CF
    • severe protein-calorie malnutrition
    • hereditary
    • idiopathic

**Signs and Symptoms**

• early stages
  • recurrent attacks of severe abdominal pain (upper abdomen and back)
  • chronic painless pancreatitis: 10%
• late stages: occurs in 15% of patients
  • malabsorption syndrome when >90% of function is lost, steatorrhea
  • diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

**Investigations**

• laboratory
  • increase in serum glucose
  • increase in serum ALP, less commonly bilirubin (jaundice)
  • serum amylase and lipase usually normal
  • stool elastase is low in steatorrhea
• AXR: pancreatic calcifications
• U/S or CT: calcifications, dilated pancreatic ducts, pseudocyst
• MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
• EUS: abnormalities of pancreatic parenchyma and pancreatic ducts, most sensitive test
• 72-h fecal fat test: measures exocrine function
• secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
• fecal pancreatic enzyme measurement (elastase-1, chymotrypsin): available only in selected centres

**Treatment**

• most common problem is pain, difficult to control
• general management
  • total abstinence from alcohol
  • enzyme replacement may help pain by resting pancreas via negative feedback
  • analgesics
  • celiac ganglion blocks
  • time: pain decreases with time as pancreas “burns out”
• endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct
• surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
• steatorrhea
  • pancreatic enzyme replacement
  • restrict fat, increase carbohydrate and protein (may also decrease pain)
  • neither endoscopy nor surgery can improve pancreatic function

**Autoimmune Pancreatitis**

• most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

**Investigations**

• histology: lymphocyte and plasma cell infiltration of pancreas
• imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
• serology: increased serum IgG4
• other organ involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

**Treatment**

• responds to prednisone
Clinical Nutrition

Determination of Nutritional Status

- Corrected weight loss (expressed as body mass index [kg/m²]) is the most important parameter in assessing need for nutritional support.
- Subjective Global Assessment: a simple bedside tool to assess nutritional status, to help identify those who will benefit from nutritional support.

Investigations

- Plasma proteins: albumin, pre-albumin (shorter half-life than albumin), transferrin.
- Decrease may indicate decreased nutritional status or disease state.
- Thyroid-binding globulin, retinol-binding protein (may be too sensitive).
- Anthropometry (e.g., triceps skinfold thickness, grip strength) less often used.

Enteral Nutrition

Definition

- Enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine.
- Choice of tubes: nasogastric (NG), nasojejunal (NJ), percutaneous endoscopic gastrostomy ("G-tube" or "PEG tube"), percutaneous endoscopic jejunostomy (J-tube) or tubes can be placed radiologically, surgically.

Indications

- Oral feeding inadequate or contraindicated.

Feeds

- Polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre.
- Elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity).
- Specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients.

Relative Contraindications

- Non-functioning gut (e.g., intestinal obstruction, enterointestinal or enterocutaneous fistulae).
- Uncontrolled diarrhea.
- GI bleeding.

Complications

- Aspiration.
- Diarrhea.
- Refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium.
- Overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein).

Enteral Nutrition Advantages over Parenteral Nutrition

- Fewer serious complications (especially sepsis).
- Nutritional requirements for enteral administration better understood.
- Can supply gut-specific fuels such as glutamine and short chain fatty acids.
- Nutrients in the intestinal lumen prevent atrophy of the gut and pancreas.
- Prevents gallstones by stimulating gallbladder motility.
- Much less expensive.
Parenteral Nutrition

**Definition**
- Parenteral nutrition (PN) is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion.

**Indications**
- Short-term (<1 mo)
  - Whenever GI tract not functioning
  - Only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult to control sepsis.
  - Pre-operative: only useful in severely malnourished (e.g., loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk.
  - Renal failure: PN shown to increase rate of recovery; no increase in survival.
  - Liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival.
  - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective).
  - Some evidence for efficacy, but convincing data not available for:
    - Radiation/chemotherapy-induced enteritis
    - AIDS with wasting diarrhea
    - Severe acute pancreatitis
- Long-term (>1 mo): can be given at home
  - Severe untreatable small bowel disease (e.g., radiation enteritis, extensive CD, high output fistulae)
  - Following surgical resection of >70% of small bowel (e.g., small bowel infarction)
  - Severe motility diseases (e.g., scleroderma affecting bowel)

**Relative Contraindications**
- Functional GI tract for enteral nutrition
- Active infection; at least until appropriate antibiotic coverage
- Inadequate venous access; triple-lumen central venous lines usually prevent this problem
- Unreliable patient or clinical setting

**Complications of PN**
- Sepsis: Most serious of the common complications
- Mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- Metabolic: CHF, hyperglycemia, gallstones, cholestasis

Enteral vs. Parenteral Nutrition for Acute Pancreatitis
Cochrane DB of Syst Rev 2010;1:CD002837

**Purpose:** Compare EN vs. TPN on mortality, morbidity, and hospital stay in patients with pancreatitis.

**Study Selection:** RCTs of TPN vs. EN in pancreatitis.

**Results:** Eight trials (n=348) were included. Enteral nutrition decreases RR of death (0.50); multiple organ failure (0.55), infection (0.39), and other local complications (0.70). It also decreased hospital stay by 2.37 d.

**Conclusion:** EN reduces mortality, organ failure, infections, and length of hospital stay in patients with pancreatitis.

Landmark Gastroenterology Trials

Table

<table>
<thead>
<tr>
<th>Trial</th>
<th>Reference</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>MELD score as a predictor of death in chronic liver disease</td>
<td>Gastroenterology 2003;124:91-6</td>
<td>MELD score can be applied for allocation of donor livers as it accurately predicts 3 mo mortality in patients with chronic liver failure</td>
</tr>
<tr>
<td>Infliximab, azathioprine, or combination for Crohn's disease</td>
<td>NEJM 2010; 362:1383-95</td>
<td>In moderate-severe Crohn's disease, infliximab + azathioprine was more likely to result in corticosteroid-free remission than infliximab monotherapy. Infliximab monotherapy was more effective than azathioprine monotherapy. Similar results have been reported for ulcerative colitis (Gastroenterology 2014; 146:392-400)</td>
</tr>
<tr>
<td>Enteral versus parenteral nutrition for acute pancreatitis</td>
<td>Cochrane DB Syt Rev 2010; 1: CD002837</td>
<td>For acute pancreatitis, no trial was convincing alone, but in aggregate, enteral feeds via nasogastric tube is preferable to either no feeding or parenteral nutrition</td>
</tr>
<tr>
<td>Rifaximin treatment in hepatic encephalopathy</td>
<td>NEJM 2010; 362:1071-81</td>
<td>The most convincing of several articles establishing this non-absorbable antibiotic as the treatment of choice for hepatic encephalopathy for maintaining remission from hepatic encephalopathy and reducing hospitalization associated with the disease</td>
</tr>
<tr>
<td>Adenoma detection rate and risk of colorectal cancer and death</td>
<td>NEJM 2014; 370:1298-1306</td>
<td>A high miss rate for colorectal cancers has been suggested, chiefly in the right colon. This study demonstrates a method of assessing the competence of endoscopists in detecting cancers using adenoma detection rate (the proportion of colposcopic exams in which a physician detects one or more adenomas) as a surrogate marker. Adenoma detection rate was associated with lower risk of interval colorectal cancer and has launched quality assurance programs for screening colonoscopies</td>
</tr>
<tr>
<td>Prednisolone or pentoxifylline for alcoholic hepatitis</td>
<td>NEJM 2015; 372:1619-28</td>
<td>For alcoholic hepatitis, prednisolone improved survival when the Maddrey's discriminant function &gt; 32, but the benefit did not reach statistical significance and pentoxifylline was of no advantage at all. Other studies had shown some benefit with pentoxifylline, but this study was the most definitive</td>

**Basic Anatomy Review**

**Figure 1. Abdominal incisions**

**Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)**

1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
   - Camper’s fascia (fatty) → Dartos fascia
   - Scarpa’s fascia (membranous) → Colles’ superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
   - external oblique → inguinal ligament → external spermatic fascia and fascia lata
   - internal oblique → cremasteric muscle/fascia
   - transversus abdominis → posterior inguinal wall
4. transversalis fascia → internal spermatic fascia
5. preperitoneal fat
6. peritoneum → tunica vaginalis

**Midline Abdominal Wall Layers (superficial to deep)**

1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba
   - above arcuate line (midway between symphysis pubis and umbilicus)
     - anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
     - posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
   - below arcuate line
     - aponeuroses of external oblique, internal oblique, transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia
6. peritoneum
Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord

## Differential Diagnoses of Common Presentations

### Acute Abdominal Pain

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two main patterns constituting urgent general surgery referrals are peritonitis and obstruction

<table>

    - Sigmoid veins (16)
    - Superior rectal veins (17)
  - ii) Pancreatic veins |
  - iii) Left gastroepiploic vein |
  - iv) Short gastric veins (6)
- Left gastric (coronary) vein (2)
- Right gastric vein (3)
- Cystic vein (4)
- Paraumbilical vein

### Key Tests for Specific Diagnosis

- ALP, ALT, AST, bilirubin
- Lipase/amylase
- Urease
- β-hCG (in women of childbearing age)
- Troponins
- Lactate

### Key Tests for or Preparation

- CBC, electrolytes, creatinine, glucose
- INR/PTT
- CXR (if history of cardiac or pulmonary disease)
- ECG if clinically indicated by history or if >69 years and no risk factors

### Types of Peritonitis

- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

### Localization of Pain

Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation; kidney, ureter, ovary, or somatotopically innervated structures are more likely to cause referred lateralized pain

### Referred Pain

- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (right paracolic gutter)
- Hip pain: to groin

**Abdominal Mass**

**Most Common Presentations of Surgical Pain**
- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = ischemic bowel
- Vague pain that subsequently localizes = appendicitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate surgical intervention.
### Gastrointestinal Bleeding

- see Gastroenterology, G25 and G27

#### Indications for Surgery
- failure of medical management
- exsanguinating hemorrhage: hemodynamic instability despite vigorous resuscitation
- recurrent hemorrhage after initial stabilization procedures with up to two attempts of endoscopic hemostasis
- prolonged bleeding with transfusion requirement >3 units
- bleeding at rate >1 unit/8 h

#### Surgical Management of GI Bleeding

**UGIB**
- bleeding from a source proximal to the ligament of Treitz
- often presents with hematemesis and melena unless very brisk (then can present with hematochezia)
- initial management with endoscopy; if fails, then consider surgery
- PUD accounts for approximately 55% of severe UGIB

**LGIB**
- bleeding from a source distal to the ligament of Treitz
- often presents with BRBPR unless proximal to transverse colon
  - may occasionally present with melena
- initial management with colonoscopy to detect and potentially stop source of bleeding
- 75% of patients will spontaneously stop bleeding, however if bleeding continues barium enema should not be performed
- angiography or RBC scan to determine source as indicated
- surgery indicated if bleeding is persistent - aimed at resection of area containing source of bleeding
- obscure bleed may require blind total colectomy if the source is not found

*Managed surgically in most cases

#### Jaundice

- see Gastroenterology, G40

#### Indications for Urgent Operation

- IHOP
- Ischemia
- Hemorrhage
- Obstruction
- Perforation

#### Overt bleeding: obvious hemorrhage or melena per rectum visible to naked eye

#### Occult bleeding: bleeding per rectum is not obvious to naked eye (e.g. positive guaiac test)

#### Obusc bleeding: overt bleeding with no identifiable source after colonoscopy and endoscopy

#### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

Recent study by Vilaume et al., demonstrates that a restrictive transfusion strategy (transfusion with hemoglobin below 70 g/L) significantly improves outcomes in patients with acute UGB, compared to a liberal transfusion strategy (transfusion with hemoglobin below 90 g/L). Refer to study for details.

#### Biochemical Signs for Differentiating Jaundice

- Hepatocellular: Elevated bilirubin + elevated ALP/AST
- Cholestatic: Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary U/S
- Hemolysis: ↓ haptoglobin ↑ LDH

Note: cholestatic jaundice is often surgical
Pre-Operative Preparations

Considerations
- informed consent (see Ethical, Legal, and Organizational Medicine, ELOM6)
- screening questionnaire to determine risk factors e.g. age, exercise capacity, medication use, allergies
- consider pre-operative anesthesia, medicine consult as indicated to optimize patient status
- NPO according to guidelines (see Anesthesia and Perioperative Medicine, A4)
- IV – balanced crystalloid at maintenance rate (4:2:1 rule → roughly 100-125 cc/h): normal saline or Ringer’s lactate; bolus to catch up on estimated losses including losses from bowel prep
- appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- patient’s regular medications included with the exception of hypoglycemic agents, diuretics and ACEI
- patients on steroids may require stress dose coverage, anticoagulation/antiplatelet medication must be managed to decrease surgical bleeding but not put patient at risk for increased thrombotic events (e.g. switching from warfarin to LMWH)
- prophylactic antibiotics depending on wound class (within 1 h prior to incision): usually cefazolin (Ancef®) ± metronidazole (Flagyl®)
- consider bowel prep: cleans out bowel and decreases bacterial population
  - oral cathartic (e.g. fleet Phosphosoda®) starting previous day
  - in selected cases, current evidence does not support routine use
- consider VTE prophylaxis for all inpatient surgery (LMWH or heparin)
- do not hold anticoagulation prior to surgery unless epidural is expected
- smoking cessation and weight loss pre-operative can significantly decrease post-operative complications
- infection: delay elective surgery until infection controlled including respiratory infection particularly in asthma patients

Investigations
- see Anesthesia and Perioperative Medicine, A4
- routine pre-operative laboratory investigations for elective procedures should be selective
  - only ASA class and surgical risk have been found to independently predict post-operative adverse effects
- blood components: group and screen or cross and type depending on procedure
- CBC, electrolytes, creatinine
- INR/PT, PTT
- CXR (PA and lateral) for patients with history of cardiac or pulmonary disease
- ECG as indicated by history or if >69 yr and no risk factors
- β-hCG testing in all women of reproductive age

Drains
- NGT
  - indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, feeding, if necessary
  - contraindications: suspected basal skull fracture, obstruction of nasal passages due to trauma
- Foley catheter with urometer
  - indications: to accurately monitor urine output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
  - contraindications: suspected urethral injury, difficult insertion of catheter

Surgical Complications
- general principles in preventing complications during the post-operative period include
  - frequent examination of the patient (daily or more) and their wound
  - removal of surgical tubes as soon as possible (e.g. Foley catheters and surgical drains)
  - early ambulation
  - monitor fluid balance and electrolytes
  - analgesia - enough to adequately address pain, but not excessive
  - skillful nursing care

Post-Operative Fever
- fever does not necessarily imply infection particularly in the first 24-48 h post-operative
- fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids, or immunosuppression
- timing of fever may help identify cause
  - hours after surgery - POD #1 (immediate)
    - inflammatory reaction in response to trauma from surgery; unlikely to be infectious
    - reaction to blood products received during surgery
    - malignant hyperthermia
- POD #5-8 (wound infection - if earlier think streptococcal or clostridial infection)
- POD #8+ (thrombosis – DVT/PE)
- Wonder drugs POD #1+ (drug)

Best Practice in General Surgery (BPGS)

http://www.bpgs.ca/
BPGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains BSM-based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up-to-date pre-operative and general treatment guidelines

Drain Size

Measured by the unit French:
French = diameter (mm) x 3

Pre and Post-Operative Orders

ADDAVIFS
Admit to ward X under Dr. Y
Diagnosis
Diet
Activity
Vitals (q8h from ED and post-operative is standard)
IV, Investigations, Ins and Outs
Drugs, Dressings, Drains
Special procedures

5 Vs of Post-Operative Fever

Word POD #1-2 (pulmonary – atelectasis, pneumonia)
Water POD #3-5 (urine – UTI)
Wound POD #5-8 (wound infection - if earlier think streptococcal or clostridial infection)
Walk POD #8+ (thrombosis – DVT/PE)
Wonder drugs POD #1+ (drug)
- POD #1-2 (acute)
  ◆ atelectasis (most common cause of fever on POD #1)
  ◆ early wound infection (especially *Clostridium*, Group A *Streptococcus* – feel for crepitus and look for "dishwater" drainage)
  ◆ aspiration pneumonitis
  ◆ other: Addisonian crisis, thyroid storm, transfusion reaction
- POD #3-7 (subacute): likely infectious
  ◆ UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, leakage at bowel anastomosis (tachycardia, hypotension, oliguria, abdominal pain)
- POD #8+ (delayed)
  ◆ intra-abdominal abscess, DVT/PE (can be anytime post-operative, most commonly POD #8-10), drug fever
  ◆ other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, *C. difficile* colitis, endocarditis

### Treatment
- treat primary cause
- antipyrexia (e.g. acetaminophen)

## Wound/Incisional Complications

**WOUND CARE** (see *Plastic Surgery*, PL8)
- can shower POD #2-3 after epithelialization of wound
- dressings can be removed POD #2 and left uncovered if dry
- examine wound if wet dressing, signs of infection (fever, tachycardia, pain)
- skin sutures and staples can be removed POD #7-10
  ◆ exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, immunosuppressed) removed POD #14, earlier if signs of infection
- negative pressure dressings consist of foam and suction, promote granulation
  ◆ ideal for large (grafted sites) or non-healing wounds (irradiated skin, ulcer)

**DRAINS**
- drains may be placed selectively at the time of surgery to prevent fluid accumulation (blood, pus, serum, bile, urine)
  ◆ can be used to assess quantity of third space fluid accumulation post-operatively
- potential route of infection; to decrease risk of wound infection bring out through separate incision (vs. operative wound) and remove as soon as possible
- types of drains
  ◆ open (e.g. Penrose), higher risk of infection
  ◆ closed: 1) Gravity drainage (e.g. Foley catheter); 2) Underwater-seal drainage system (e.g. chest tube); 3) Suction drainage (e.g. Jackson-Pratt)
  ◆ sump (e.g. NGT)
- monitor drain outputs daily
- drains should be removed once drainage is minimal (usually <30-50 cc/24 h)
- drains do not guarantee that the patient will not form a collection of fluid
- ridged drains can erode through internal structures, and excessive suction can cause necrosis
- evidence does not support routine post-operative drainage of abdominal cavity

## SURGICAL SITE INFECTION

### Etiology
- *S. aureus*, *E. coli*, *Enterococcus*, *Streptococcus* spp., *Clostridium* spp.

### Risk Factors

#### Table 4. Procedures and Their Impact on Surgical Site Infection

<table>
<thead>
<tr>
<th>Classification</th>
<th>Clean</th>
<th>Clean-Contaminated</th>
<th>Contaminated</th>
<th>Dirty/Infected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Incision under sterile conditions; nontraumatic; no entrance of hollow organ</td>
<td>Incision under sterile conditions; ENTRANCE of hollow viscus; no evidence of active infection; minimal contamination</td>
<td>Incision under sterile conditions; MAJOR contamination of wound during procedure (i.e. gross spillage of stool, infection in biliary, respiratory, or GU systems)</td>
<td>Established infection present before wound is made in skin</td>
</tr>
<tr>
<td>Example</td>
<td>Wound created to repair hernia</td>
<td>Routine cholecystectomy; colon resection</td>
<td>Bowel obstruction with enterotomy and spillage of contents; necrotic bowel resection; fresh traumatic wounds</td>
<td>Appendiceal abscess; traumatic wound with contaminated devitalized tissue; perforated vescus</td>
</tr>
<tr>
<td>Infection Rate</td>
<td>&lt;2%</td>
<td>3-4%</td>
<td>7-10%</td>
<td>30-40%</td>
</tr>
<tr>
<td>Wound Closure</td>
<td>Primary closure</td>
<td>Primary closure</td>
<td>Often secondary closure</td>
<td>Secondary closure</td>
</tr>
</tbody>
</table>
• patient characteristics
  ■ age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, chemotherapy
• other factors
  ■ prolonged pre-operative hospitalization, reduced blood flow, break in sterile technique, multi-antibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, hypothermia

Prophylaxis
• pre-operative antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamicin)
  ■ within 1 h pre-incision; can redose at 1-2 half-lives (~q4-8h) in the OR
  ■ not required for low risk elective cholecystectomy, hemorrhoidectomy, fistulotomy, sphincterotomy for fissure
• some evidence suggests role in breast surgery
  ■ reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection, hair removal should not be performed unless necessary; if so, clipping superior to shaving chlorhexidine-alcohol wash of surgical site
• normothermia (maintain patient temperature 36-38°C during OR)
• hyperoxygenation (consider FiO2 of 80% in OR)
• consider delayed primary closure of incision for contaminated wounds

Clinical Presentation
• typically fever POD #5-8 (Streptococcus and Clostridium can present in 24 h)
• pain, blanchable wound erythema, induration, purulent discharge, warmth
• complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, hernia

Treatment
• examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
• re-open affected part of incision, drain, pack, heal by secondary intention in most cases
• for deeper infections, debride necrotic and non-viable tissue
• antibiotics and dermabration of erythema only if cellulitis or immunodeficiency

Wound Hemorrhage/Hematoma
• secondary to inadequate surgical control of hemostasis

Risk Factors
• anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial HTN, severe cough
• more common with transverse incisions through muscle, due to cutting of muscle

Clinical Features
• pain, swelling, discolouration of wound edges, leakage
• rapidly expanding neck hematoma can compromise airway and is a surgical emergency; consider having a suture kit at bedside in all neck surgery in the event of having to open the wound urgently

Treatment
• pressure dressing
• open drainage ± wound packing (large hematoma only)
• if significant bleeding, may need to re-operate to find source (often do not find a discrete source)

Seroma
• fluid collection other than pus or blood
• secondary to transection of lymph vessels
• delays healing
• increased infection risk

Treatment
• consider pressure dressing ± needle drainage
• if significant may need to re-operate

Wound Dehiscence
• disruption of fascial layer, abdominal contents contained by skin only
• 95% caused by intact suture tearing through fascia

Clinical Features
• typically POD #1-3; most common presentation sign is serosanguinous drainage from wound ± evisceration
• palpaton of wound edge: should normally feel a “healing ridge” from abdominal wall closure (raised area of tissue under incision)
Risk Factors
- local: technical failure of closure, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing, transverse incision
- systemic: smoking, malnutrition (hypoproteinemia, vitamin C deficiency), connective tissue diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy, obesity, other (e.g. age, sepsis, uremia)
- DM alone is not a risk factor

Treatment
- place moist dressing over wound with binder around abdomen and transfer to OR
- may consider conservative management with debridement of fascial and/or skin margins
- evisceration, also known as 'burst abdomen', is a surgical emergency: take patient for operative reclusion.

Urinary and Renal Complications

Urinary Retention
- may occur after any operation with general anesthesia or spinal anesthesia
- more likely in older males with history of benign prostatic hyperplasia, patients on anticholinergics

Clinical Presentation
- abdominal discomfort, palpable bladder, overflow incontinence, post-void residual urine volume >100 mL

Treatment
- Foley catheter to rest bladder, then trial of voiding

Oliguria/Anuria (see Nephrology, NP18)

Etiology
- prerenal vs. renal vs. postrenal
- most common post-operative cause is prerenal ± ischemic ATN
  - external fluid loss: hemorrhage, dehydration, diarrhea
  - internal fluid loss: third-spacing due to bowel obstruction, pancreatitis

Clinical Presentation
- urine output <0.5 cc/kg/h, increasing Cr, increasing BUN

Treatment
- according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

Post-Operative Dyspnea
- see Respiratory Complications next and Cardiac Complications, GS12

Etiology
- respiratory: atelectasis, pneumonia, pulmonary embolus (PE), ARDS, asthma, pleural effusion
- cardiac: MI, arrhythmia, CHF
- inadequate pain control

Respiratory Complications

Atelectasis
- comprises 90% of post-operative pulmonary complications

Clinical Features
- low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, tachypnea

Risk Factors
- COPD, smoking, obesity, elderly persons
- upper abdominal/thoracic surgery, oversedation, significant post-operative pain, poor inspiratory effort
Treatment
- pre-operative prophylaxis
  - smoking cessation (best if >8 wk pre-operative)
- post-operative prophylaxis
  - incentive spirometry, deep breathing exercise, chest physiotherapy, intermittent positive-pressure breathing
  - selective NGT decompression after abdominal surgery
  - short-acting neuromuscular blocking agents
  - minimize use of respiratory depressant drugs, appropriate pain control, early ambulation

PNEUMONIA/PNEUMONITIS
- may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

Risk Factors
- aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NGT, pregnancy, seizure disorder
- non-aspiration: atelectasis, immobility, pre-existing respiratory disease

Clinical Features
- productive cough, fever
- tachycardia, cyanosis, respiratory failure, decreased LOC
- CXR: pulmonary infiltrate

Treatment
- prophylaxis: see atelectasis prophylaxis, pre-operative NPO/NGT, rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. ceftriaxone, metronidazole)

PULMONARY EMBOLUS (See Respirology, R18)

Clinical Features
- unilateral leg swelling and pain (DVT as a source of PE), sudden onset shortness of breath, tachycardia, fever
- most commonly POD #8-10, but can occur anytime post-operatively, even after discharge
- diagnosis made by Chest CT scan usually

Treatment
- initial treatment IV heparin or therapeutic- dose LMWH, bridging to therapeutic anticoagulation is required for a minimum of 3 months; for patients with cancer, or other risk factors for hypercoagulability, the duration of anticoagulation may be longer
- Greenfield (IVC) filter if contraindications to anticoagulation
- prophylaxis: subcutaneous heparin (5,000 U bid) or LMWH, compression stockings (TED™ Hose), sequential compression devices

PULMONARY EDEMA

Etiology
- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, alveolar injury due to toxins (e.g. ARDS)
- more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anesthesia

Clinical Features
- shortness of breath, crackles at lung bases, CXR abnormal

Treatment (LMNOP)
- Lasix
- Morphine (decreases symptoms of dyspnea, venodilator and afterload reduction)
- Nitrates (venodilator)
- Oxygen + non-invasive ventilation
- Position (sit patient up)

New onset “asthma” and wheezing in the elderly is cardiogenic until proven otherwise
RESPIRATORY FAILURE

Clinical Features
- dyspnea, cyanosis, evidence of obstructive lung disease
- earliest manifestations – tachypnea and hypoxemia (RR >25, pO\textsubscript{2} <60)
- pulmonary edema, unexplained decrease in SaO\textsubscript{2}

Treatment
- ABCs, O\textsubscript{2}, ± positive pressure ventilation, intubation
- bronchodilators, diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep PaO\textsubscript{2} >60, consider ARDS

Cardiac Complications
- abnormal ECGs common in post-operative period (compare to pre-operative ECG)
- common arrhythmias: supraventricular tachycardia, atrial fibrillation (secondary to fluid overload, PE, MI)

MYOCARDIAL INFARCTION
- see Cardiology and Cardiac Surgery, C27
- surgery increases risk of MI
- incidence
- 0.5% in previously asymptomatic men >50 yr old
- 40-fold increase in men >50 yr old with previous MI

Risk Factors
- pre-operative HTN, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intra-operative hypotension
- operations >3 h
- angina

Clinical Features
- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, hypotension

Intra-Abdominal Abscess

Definition
- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

Etiology
- usually polymicrobial: Gram-negative bacteria, anaerobes
- consider Gram-positives if coexisting cellulitis

Risk Factors
- emergency surgery, contaminated OR
- GI surgery with anastomoses
- poor healing risk factors (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

Clinical Features
- persistent spiking fever, dull pain, weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison’s pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, psoas

Investigations
- CBC, blood cultures x2
- CT ± IV and water-soluble contrast
- DRE (pelvic abscess)
Treatment
- drain placement by interventional radiology (preferred), laparoscopy, open drainage
- subsequent antibiotic coverage; ceftriaxone + metronidazole or piperacillin-tazobactam (PepTazo)

Paralytic Ileus
- see Bowel Obstruction, GS23

Delirium
- see Psychiatry, PS19 and Neurology, N20

Thoracic Surgery

Hiatus Hernia

Figure 6. Types of hiatus hernia

SLIDING HIATUS HERNIA (TYPE I)
- see Figure 6
- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

Risk Factors
- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, heavy lifting)
- smoking

Clinical Features
- majority are asymptomatic
- hernias frequently associated with GERD due to decreased competence of LES

Complications
- most common complication is GERD
- other complications are rare and are related to reflux
- esophagitis (dysphagia, heartburn)
- consequences of esophagitis (peptic stricture, Barrett’s esophagus, esophageal carcinoma)
- extra-esophageal complications (aspiration pneumonitis/pneumonia, asthma type bronchospasm, cough, laryngitis)

Investigations
- barium swallow, endoscopy (esophago-gastroscopy), or esophageal manometry (technique for measuring LES pressure)
- 24 h esophageal pH monitoring to quantify reflux
- endoscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett’s esophagus, and cancer
Treatment
- lifestyle modification
  - stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint, and fat
- medical
  - antacid, H₂-antagonist, PPI, prokinetic agent
- surgical (<15%)
  - if failure of medical therapy, complications of GERD such as esophageal stricture, severe nocturnal aspiration, Barrett's esophagus
  - anti-reflux procedure (usually laparoscopic) e.g. Nissen fundoplication
    - fundus of stomach is wrapped around the lower esophagus and sutured in place
    - 90% success rate

PARAESOPHAGEAL HIATUS HERNIA (TYPE II)
- see Figure 6
- herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
- least common esophageal hernia (<10%)

Clinical Features
- usually asymptomatic due to normal GE junction
- pressure sensation in lower chest, dysphagia

Complications
- hemorrhage, incarceration, strangulation (gastric volvulus), obstruction, gastric stasis ulcer (Cameron's lesion – causes Fe-deficiency anemia)

Treatment
- surgery to address symptoms or treat/prevent complications
- reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
- may consider suturing stomach to anterior abdominal wall (gastropexy)
- in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy) to anchor the stomach in the abdomen

MIXED HIATUS HERNIA (TYPE III)
- see Figure 6
- combination of Types I and II

TYPE IV HERNIA
- herniation of stomach and other abdominal organs into thorax: colon, spleen, small bowel
- Fe-deficiency anemia is common

Esophageal Perforation

Etiology
- iatrogenic (most common)
  - endoscopic, dilatation, biopsy, intubation, operative, NGT placement (rare)
- barogenic
  - trauma
  - repeated, forceful vomiting (Boerhaave's syndrome)
- other: convulsions, defecation, labour (rare)
- ingestion injury
  - foreign body, corrosive substance
- carcinoma

Clinical Features
- neck or chest pain
- fever, tachycardia, hypotension, dyspnea, respiratory compromise
- subcutaneous emphysema, pneumothorax, pleural effusion, and hematemesis,

Investigations
- CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air, widened mediastinum
- CT chest: pneumomediastinum, pleural effusion, pneumothorax, contrast in the chest, subq emphysema
- Upper GI swallow study with water soluble contrast. If negative then perform with diluted barium: contrast extravasation
Treatment
• supportive if rupture is contained
  • NPO, fluid resuscitation, broad-spectrum antibiotics, possible percutaneous drainage of mediastinum or pleura
• surgical
  • <24 h: primary closure of a healthy esophagus or resection of diseased esophagus
  • >24 h or non-viable wound edges
    • diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, gastrostomy/jejunostomy for decompression/feeding)

Complications
• sepsis, abscess, fistula, empyema, mediastinitis, death
• post-operative esophageal leak
• mortality 10-50% dependent on timing of diagnosis

Esophageal Carcinoma

Epidemiology
• M:F = 3:1
• onset 50-60 yr of age
• upper (20-33%), middle (33%), lower (33-50%)
• main types
  • most common worldwide: SCC in upper 2/3 of esophagus
  • most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

Risk Factors
• geographic variation in incidence
• SCC
  • underlying esophageal disease such as strictures, diverticula, achalasia
  • smoking, alcohol, hot liquids
  • more common in patients from Asia
• adenocarcinoma
  • Barrett’s esophagus (most important), smoking, obesity (increased reflux), GERD

Clinical Features
• progressive dysphagia (mechanical): first solids then liquids
• odynophagia then constant pain
• constitutional symptoms
• regurgitation and aspiration (aspiration pneumonia)
• hematemesis, anemia
• direct, hematogenous, or lymphatic spread
  • trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac and mediastinal nodes

Investigations and Staging
• barium swallow: shows narrowing – suggestive but not diagnostic
• endoscopic biopsy and assess resectability
• both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
• endoscopic U/S (EUS)
  • visualize local disease
  • regional nodal involvement (number of nodes may be more important than location)
• bronchoscopy + thoracoscopy
  • rule out airway invasion in tumours of the upper and mid esophagus
• full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, LFTs, etc.)
• PET scan more sensitive than CT in detecting metastatic disease

Treatment
• if present with distant metastatic disease
  • treat with systemic therapy and treat symptoms (esophageal stent)
• if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  • multimodal therapy
    • concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    • possibility of curative esophagectomy after chemoradiation if disease responds well
  • if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation

Esophageal Carcinoma

Epidemiology
• M:F = 3:1
• onset 50-60 yr of age
• upper (20-33%), middle (33%), lower (33-50%)
• main types
  • most common worldwide: SCC in upper 2/3 of esophagus
  • most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

Risk Factors
• geographic variation in incidence
• SCC
  • underlying esophageal disease such as strictures, diverticula, achalasia
  • smoking, alcohol, hot liquids
  • more common in patients from Asia
• adenocarcinoma
  • Barrett’s esophagus (most important), smoking, obesity (increased reflux), GERD

Clinical Features
• progressive dysphagia (mechanical): first solids then liquids
• odynophagia then constant pain
• constitutional symptoms
• regurgitation and aspiration (aspiration pneumonia)
• hematemesis, anemia
• direct, hematogenous, or lymphatic spread
  • trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac and mediastinal nodes

Investigations and Staging
• barium swallow: shows narrowing – suggestive but not diagnostic
• endoscopic biopsy and assess resectability
• both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
• endoscopic U/S (EUS)
  • visualize local disease
  • regional nodal involvement (number of nodes may be more important than location)
• bronchoscopy + thoracoscopy
  • rule out airway invasion in tumours of the upper and mid esophagus
• full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, LFTs, etc.)
• PET scan more sensitive than CT in detecting metastatic disease

Treatment
• if present with distant metastatic disease
  • treat with systemic therapy and treat symptoms (esophageal stent)
• if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  • multimodal therapy
    • concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    • possibility of curative esophagectomy after chemoradiation if disease responds well
  • if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation
• if early stage (non-transmural and without evidence of nodal disease)
  ■ endoscopic mucosal resection can be considered for early mucosal cancer or high grade dysplasia
  ■ esophagectomy (transthoracic or trans-hiatal approach) and lymphadenectomy
    ■ anastomosis in chest or neck
    ■ stomach most often used for reconstruction; may also use colon
  ■ neoadjuvant chemotherapy and radiation are controversial
  ■ adjuvant chemotherapy ± radiation usually recommended for post-operative node-positive disease

**Prognosis**
• TNM status - usually poor because presentation is usually at advanced stage.

**OTHER DISORDERS**
• esophageal motor disorders (see Gastroenterology, G8)
• esophageal varices (see Gastroenterology, G26)
• Mallory-Weiss tear (see Gastroenterology, G26)

---

**Thymoma**

**Epidemiology**
• most common neoplasms in thymus including both thymoma and thymic carcinoma
• patients between 40 and 60 yr
• M > F

**Risk Factors**
• no known risk factors, strong association with myasthenia gravis and other paraneoplastic syndromes

**Clinical Presentation**
• frequently asymptomatic: incidental finding on imaging
• symptoms related to tumour size and location or myasthenia gravis: chest pain, SOB, cough, phrenic nerve palsy
• ddx includes lymphoma, other anterior mediastinal tumours (see Respirology, R21)

**Investigations**
• CT chest (and/or MRI)
• Germ cell tumour markers (β-hCG, alpha fetoprotein), thyroid function, PFTs

**Treatment**
• for patients with resectable disease
• surgical resection of thymus via median sternotomy or VATS depending on the size
• ± post-operative radiation based on Masaoka staging
• for non-surgical patients
• multimodal therapy including neoadjuvant or palliative chemotherapy and post-operative chemoradiotherapy if de-bulking procedure feasible

**Prognosis**
• depends upon stage of disease and resectability
• generally slow growing tumours and have good prognosis

---

**Pleura, Lung, and Mediastinum**

• see Respirology, R21

---

**Tube Thoracostomy**

**Indications**
• to drain abnormal large-volume air or fluid collections in the pleural space
  ■ hemothorax, pleural effusion, chylothorax, empyema
  ■ pneumothorax, if
    ■ large or progressive
    ■ patient is on mechanical ventilation
    ■ bronchopleural fistula
    ■ tension pneumothorax
• to treat symptomatic and/or recurrent pleural effusion
  ■ see Respirology, R22
• for long-term drainage of malignant effusions use: 1. Tunneled pleural catheter; 2. Pleural drainage and chemical pleurodesis
• via facilitation of pleurodesis (obliteration of the pleural space by instilling talc or doxycycline to cause fibrosis and adherence of parietal and visceral pleura)
Complications
• overall complications are rare (1-3%)
• malposition (most common complication), especially by inexperienced operators
  - tubes may dissect along the external chest wall, or may be placed below the diaphragm
• bleeding (anticoagulation is a relative contraindication)
• local infection, empyema
• perforation of lung parenchyma or vasculature
• risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)

Lung Transplantation

Conditions Leading to Transplantation
• chronic acquired lung disease: COPD
• genetic: CF, emphysema due to α-1 antitrypsin deficiency
• idiopathic interstitial pneumonias: IPF, nonspecific interstitial pneumonitis
• HTN-related: IPAH, secondary pulmonary HTN, Eisenmenger’s syndrome
• other: sarcoidosis, lymphangioleiomyomatosis, pulmonary Langerhans cell histiocytosis

Clinical Indications
• transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
• patients who are symptomatic during activities of daily living and have limited expected survival over the next 2 yr

Criteria for Transplantation
• lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
• transplant benefit = post-transplant survival (days) – waitlist survival (days)

Contraindications
• uncontrolled or untreatable pulmonary or extrapulmonary infection
• malignancy in the last 2 yr
• advanced cardiopulmonary disease
• significant chest wall/spinal deformity
• active cigarette smoking
• HIV infection, ongoing HBV or HCV infections

Post-Operative Complications
• primary graft dysfunction: main cause is ischemia-reperfusion injury, graded by PaO₂/FiO₂ ratio and CXR findings
• airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, fistula)
• chronic graft dysfunction: bronchiolitis obliterans syndrome
• infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, mycobacteria)
• malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi’s sarcoma, bladder)

Prognosis
• median survival for all adult recipients: 5.4 yr
• 1 yr survival: COPD > IPF > IPAH
• 10 yr survival: CF, α-1 antitrypsin deficiency > IPAH > COPD, IPF

Chronic Obstructive Pulmonary Disease

Treatment
• indications for surgical management
  • dyspnea despite maximal medical therapy and pulmonary rehabilitation
  • CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
  • may be used as a bridging procedure to lung transplantation
• contraindications
  • age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
  • homogeneously distributed emphysematous changes with areas of preserved lung tissue
  • diffusing capacity of lung for carbon monoxide <20% of predicted, PaCO₂ >60 mmHg, PaO₂ <45 mmHg
• surgical procedures
  • lung volume reduction surgery: wedge excision of emphysematous tissue
  • bilateral or unilateral, thoracotomy or VATS
Complications of Treatment
- air leak: may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

Prognosis
- total mortality at 2 yr same as with maximal medical therapy, but better exercise capacity and quality of life with LVRS

Stomach and Duodenum

Peptic Ulcer Disease

GASTRIC ULCERS
- see Gastroenterology, G11

Indications for Surgery
- refractory to medical management
- suspicion of malignancy (even if biopsy benign)
- complications of PUD: obstruction, perforation, bleeding (3x greater risk compared to duodenal ulcers)
- surgical treatment is increasingly rare due to H. pylori eradication and medical treatment

Procedures
- ligation of bleeding vessels
- distal gastrectomy with ulcer excision: Billroth II, Roux-en-Y gastrojejunostomy or Billroth I (rarely) reconstruction
- vagotomy and pyloroplasty only if acid hypersecretion (rare)
- wedge resection if possible or biopsy with primary repair

DUODENAL ULCERS
- see Gastroenterology, Bleeding Peptic Ulcer, G12, and Peptic Ulcer Disease, G11
- most within 2 cm of pylorus (duodenal bulb)

Indications for Surgery
- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
- refractory to medical and endoscopic management

Procedures
- omental (Graham) patch: plication of ulcer supported by overlying omental patch
- oversewing of bleeding ulcer + pyloroplasty
- treat with H. pylori eradication protocol post operatively.

Complications of Gastric Surgery
- retained antrum
- fistula (gastrocolic/gastrojejunal)
- dumping syndrome, postvagotomy diarrhea, afferent loop syndrome (see Complications of Gastric Surgery, G11)

Table 5. Complications of Duodenal Ulceration

<table>
<thead>
<tr>
<th>Complication</th>
<th>Clinical Features</th>

</tr>
</thead>
<tbody>
<tr>
<td>Perforated Ulcer (typically on anterior surface)</td>
<td>Sudden onset of pain (possibly in RLQ due to track down right paracolic gutter) Acute abdomen: rigid, diffuse guarding R厌恶 Initial chemical peritonitis followed by bacterial peritonitis</td>
<td>Investigation CXR – free air under diaphragm (70% of patients) Treatment Oversew ulcer (plication) and omental (Graham) patch – most common treatment</td>
</tr>
<tr>
<td>Posterior Penetration</td>
<td>Elevated amylase/lipase if penetration into pancreas Constant mid-epigastric pain burrowing into back, unrelated to meals</td>
<td>Resuscitation initially with crystalloids; blood transfusion if necessary Diagnostic and/or therapeutic endoscopy (laser, cautery, or injection); if recurs, may have second scope Consider interventional radiology: angiography with embolization/ coiling Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and IR: oversewing of ulcer, pyloroplasty</td>
</tr>
<tr>
<td>Hemorrhage (typically on posterior surface)</td>
<td>Gastroduodenal artery involvement</td>
<td>Resuscitation initially with crystalloids; blood transfusion if necessary Diagnostic and/or therapeutic endoscopy (laser, cautery, or injection); if recurs, may have second scope Consider interventional radiology: angiography with embolization/ coiling Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and IR: oversewing of ulcer, pyloroplasty</td>
</tr>
<tr>
<td>Gastric Outlet Obstruction</td>
<td>Ulcer can lead to edema, fibrosis of pyloric channel, neoplasia N/V (undigested food, non-bilious), dilated stomach, crampy abdominal pain Succussion splash (splashing noise heard with stethoscope over the stomach when patient is shaken) Auscultate gas and fluid movement in obstructed organ</td>
<td>NGT decompression and correction of hypochloremic, hypokalemic metabolic alkalosis Medical management initially: high dose PPI therapy Surgical resection if obstruction does not resolve: either Billroth I, pyloroplasty, or gastrojejunostomy</td>
</tr>
</tbody>
</table>

Figure 9. Billroth I and Billroth II with Roux-en-Y reconstruction (gastrojejunostomy)
Gastric Carcinoma

Epidemiology
- 5th most common cancer in the world
- M:F = 3:2
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr
- incidence of adenocarcinoma <10 (US) vs. 40 (Japan, Korea) per 100,000 (incidence highest in Asia, Latin America, and Caribbean)

Risk Factors
- compensatory epithelial cell proliferation via gastric atrophy from:
  - *H. pylori*, causing chronic atrophic gastritis
  - pernicious anemia associated with achlorhydria and chronic atrophic gastritis
  - previous partial gastrectomy (>10 yr post-gastrectomy)
- host-related factors
  - blood type A
  - hereditary nonpolyposis colorectal cancer (HNPPC), hereditary diffuse gastric carcinoma (HDGC)
  - gastric adenomatous polyps
  - hypertrophic gastropathy
- genetic syndromes: hereditary diffuse gastric cancer E-cahedrin (CDH-1) gene
- environmental factors: smoking, alcohol, smoked food, nitrosoamines

Clinical Features
- clinical suspicion
  - ulcer fails to heal
  - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious, or late onset of symptoms
  - postprandial abdominal fullness, vague epigastric pain
  - anorexia, weight loss
  - burping, N/V, dyspepsia, dysphagia
  - hepatomegaly, epigastric mass (25%)
  - hematemesis, fecal occult blood, melena, iron-deficiency anemia
- metastasis
  - peritoneum, ovarian, liver, lung, brain

Investigations
- OGD and biopsy; consider EUS to assess pre-operative T-stage and N-stage
- CT chest/abdomen/pelvis (for metastatic workup see Table 7)

Treatment
- adenocarcinoma
  - proximal lesions
    - total gastrectomy and Roux-en-Y esophagejunostomy
  - distal lesions
    - distal gastrectomy: wide margins, en bloc removal of omentum and lymph nodes with Roux-en-Y or Billroth II reconstruction
  - palliation
    - limited gastric resection or endoscopic stenting to decrease bleeding and relieve obstruction, enables the patient to eat
    - radiation therapy
    - studies are showing larger role for adjuvant/ neoadjuvant and palliative chemotherapy

Signs of Metastatic Gastric Carcinoma
- Virchow’s node: left supraclavicular node
- Blumer’s shelf: mass in pouch of Douglas
- Sister Mary Joseph node: umbilical metastases
- Irish’s node: left axillary nodes
• lymphoma
  ■ H. pylori eradication, chemotherapy ± radiation, surgery in limited cases (perforation, bleeding, obstruction)

Gastrointestinal Stromal Tumour

Epidemiology
• most common mesenchymal neoplasm of GI tract
• derived from interstitial cells of Cajal (cells associated with Auerbach's plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
• 75-80% associated with tyrosine kinase (c-KIT) mutations
• most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
  typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anemia
  often discovered incidentally on CT, laparotomy, or endoscopy

Risk Factors
• Carney's triad: GISTs, paraganglioma, and pulmonary chondroma
• Type IA neurofibromatosis

Investigations
• pre-operative biopsy (endoscopic ultrasound): controversial, but useful for indeterminate lesions
  ■ not recommended if index of suspicion for GIST is high
  ■ percutaneous biopsy is NOT recommended due to high friability and risk of peritoneal spread

Treatment
• surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
• localized GIST
  ■ surgical resection with preservation of intact pseudocapsule
  ■ lymphadenectomy NOT required, as GISTs rarely metastasize to lymph nodes
  ■ consider adjuvant treatment with imatinib (Gleeve) or high-risk GIST (large, >4 cm with significant mitotic activity)
  ■ advanced disease (i.e. metastases to liver and/or peritoneal cavity)
    ■ palliative intent chemotherapy with imatinib
    ■ metastectomy may be considered for liver limited disease

Prognosis
• risk of metastatic potential depends on
  ■ tumour size (worse if >10 cm)
  ■ mitotic activity (worse if >5 mitotic figures or 50/hpf)
  ■ degree of nuclear pleomorphism
  ■ location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
  ■ metastases to liver, omentum, peritoneum; nodal metastases rare

Bariatric Surgery

• weight reduction surgery for morbid obesity
  • indications: BMI ≥40 without illness or BMI ≥35 with 1+ serious comorbidity (e.g. DM, CAD, sleep apnea, severe joint disease)

Surgical Options
• malabsorptive/restrictive
  ■ laparoscopic Roux-en-Y gastric bypass (most common – see Figure 9)
  ■ staple off small gastric pouch (restrictive) with Roux-en-Y limb to pouch (malabsorptive) with dumping syndrome physiology
  ■ most effective, higher complication rates
• restrictive
  ■ laparoscopic adjustable gastric banding
  ■ silicone band around fundus creates pouch, adjustable through port under skin
  ■ laparoscopic vertical sleeve gastrectomy
  ■ vertical stapled small gastric pouch
• malabsorptive
  ■ biliopancreatic diversion with duodenal switch
  ■ gastrectomy, enterostomy, duodenal division closure and duodenoenterostomy

Bariatric (Weight Loss) Surgery for Obesity is Considered when Other Treatments have Failed
Cochrane GB Syn Rev 2009:2:CD003641

Benefits
• Greater weight loss in patients with BMI >30 at 2 yr.
• Reduction in comorbidities (type 2 DM, HTN, and medication use).
• Improvement in quality of life at 2 yr (physical function, physical role, general health, vitality, and emotional role).

Risks
• Complications: leaks, hernias, infection, pulmonary embolism, post-operative mortality.
• Side effects specific to type of procedure (i.e. vomiting, dumping syndrome, food intolerance).
• Cholecystitis occurs as a result of rapid weight loss.
Complications
- perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
- obstruction at enteroenterostomy (see Complications of Gastric Surgery)
- staple line dehiscence
- dumping syndrome
- cholelithiasis due to rapid weight loss (20-30%)
- band abscess (if long-term)

Complications of Gastric Surgery
- most resolve within 1 yr

Alkaline Reflux Gastritis (see Figure 10A)
- duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
- treatment
  - medical: H₂-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
  - surgical: conversion of Billroth I or II to Roux-en-Y

Afferent Loop Syndrome (see Figure 10B)
- accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
- clinical features
  - early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
- treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

Dumping Syndrome (see Figure 10C)
- early – 15 min post-prandial
  - etiology
    - hyperosmotic chyme released into small bowel (fluid accumulation and jejunal distention)
  - clinical features
    - post-prandial symptoms
    - epigastric fullness or pain, emesis, nausea, diarrhea, palpitations, dizziness, tachycardia, diaphoresis
  - treatment
    - small multiple low carbohydrate, low fat, and high protein meals and avoidance of liquids with meals
    - last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
- late – 3 h post-prandial
  - etiology: large glucose load leads to large insulin release and hypoglycemia
  - treatment: small snack 2 h after meals

Blind-Loop Syndrome (see Figure 10D)
- bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
- clinical features
  - anemia/weakness, diarrhea, malnutrition, abdominal pain, and hypocalcemia
- treatment: broad-spectrum antibiotics, surgery (conversion to Billroth I)

Postvagotomy Diarrhea (see Figure 10E)
- up to 25%
- bile salts in colon inhibit water resorption
- treatment: medical (cholestyramine), surgical (reversed interposition jejunal segment)
SMALL INTESTINE

Small Bowel Obstruction

Mechanical Small Bowel Obstruction

Etiology

<td></td>
</tr>
</tbody>
</table>

Pathophysiology

- obstruction → gas & fluid (swallowed or GI secretions) accumulate proximal to site of obstruction and distal decompression → intestinal activity increases to overcome obstruction → colicky pain and diarrhea (initially)
- bowel wall edema and disruption of normal bowel absorptive function can lead to increased intraluminal fluid and transudative fluid loss into peritoneal cavity, electrolyte disturbances
- increase intramural pressure can lead to impaired microvascular perfusion leading to intestinal ischemia and necrosis (strangulated bowel obstruction)
- three types
  - partial SBO: only a portion of intestinal lumen is occluded, allows passage of some gas & fluid, low risk of strangulation
  - complete SBO: the lumen of the intestine is occluded, no passage of gas or stool, at higher risk of strangulation
  - closed-loop obstruction: segment of intestine is obstructed both proximally and distally (e.g. volvulus), leading to rapid rise in intraluminal pressure from gas and fluid that cannot escape, high risk of strangulation due to bowel wall ischemia

Risk Factors

- prior abdominal or pelvic surgery, abdominal wall or groin hernia, history of malignancy, prior radiation

Clinical Features

- 1) distinguish mechanical obstruction from ileus; 2) determine etiology of obstruction; 3) recognize partial from complete SBO; 4) differentiate simple from complicated (e.g. strangulated) obstruction
- symptoms: colicky abdominal pain, nausea/vomiting, obstipation
  - vomiting is more prominent with proximal than distal
  - more feculent vomitus suggest more established obstruction because of bacterial overgrowth
  - continue passage of gas and/or stool 6-12 h after onset of symptoms suggest partial than complete obstruction
- signs: abdominal distention (most prominent if obstruction at distal ileum), hyperactive proceeding to minimal bowel sound
- strangulated obstruction: abdominal pain disproportionate to physical exam findings suggest intestinal ischemia
  - may have tachycardia, localized abdominal tenderness, fever, marked leukocytosis, lactate acidosis

Investigations

- radiological
  - abdominal x-ray (3 views): triad of dilated small bowel (>3 cm in diameter), air-fluid levels on upright film, paucity of air in colon (high sensitivity, low specificity as ileus and LBO can present similarly)
  - CT: discrete transition zone with proximal bowel dilation, distal bowel decompression, and intraluminal contrast does not pass the transition zone
  - most importantly to r/o ischemic bowel/strangulation: pneumatosis intestinalis (free air in bowel wall) & thickened bowel wall, air in portal vein, free intraperitoneal liquids, differential wall enhancements (poor uptake of IV contrast into the wall of the affected bowel)
- other
  - less used: upper GI series/small bowel series (if no cause apparent, i.e. no hernias, no previous surgeries)
  - may consider U/S or MRI in pregnant patients

- laboratory
  - may be normal early in disease course
  - creatinine, hematocrit to assess degree of dehydration
  - fluid, electrolyte abnormalities; metabolic alkalosis due to frequent emesis; amylase elevated
  - if strangulation: leukocytosis with left shift, elevated lactate (late signs)
Small Bowel Obstruction

Treatment
- IV isotonic fluid resuscitation + urine output monitoring with catheter
  - SBO related vomiting and decrease PO intake leads to volume depletion
- NG tube in the stomach for gastric decompression; decrease nausea, distention, and risk of aspiration from vomiting
- Partial SBO/Crohn's/Carcinomatosis: conservative management with fluid resuscitation and NG tube decompression
  - 48 h of watchful waiting; if no improvement or develops complications, surgery
- Complete SBO, if no clinical features of strangulation, short course of conservative management with fluid resuscitation and NG tube decompression with frequent re-examination by surgical team
  - duration of observation varies from hours to a few days
  - if SBO fails to resolve, or if symptoms of strangulation develop then surgery

High risk for strangulation based on clinical symptoms: urgent surgery to prevent irreversible ischemia
- early post-operative SBO: if bowel function do not return within 3-5 d after surgery; usually partial, extended conservative therapy (2-3 wk) with bowel rest, fluids, and TPN is appropriate
  - surgery if presence of peritonitis or complete SBO demonstrated

Prognosis
- related to etiology; mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

Prevention
- open surgery has four fold increase in risk of SBO in 5 yr compared to laparoscopic surgery

Paralytic Ileus

Pathogenesis
- temporary, reversible impairment of intestinal motility; mostly frequently caused by:
  - abdominal operations, infections & inflammation, medications (opiates, anesthetics, psychotropics), and electrolyte abnormalities
  - passing gas is the most useful indicator
- NOT the same as intestinal pseudo-obstruction
  - chronic pseudo-obstruction refers to specific disorders that affect the smooth muscle and myenteric plexus, leading to irreversible intestinal dysmotility

Clinical Features
- symptoms and signs of intestinal obstruction without mechanical obstruction
  - bowel sounds are diminished or absent (in contrast to initial hyperactive bowel sounds in SBO)

Investigations
- routine post-operative ileus: expected, no investigation needed
- if ileus persists or occurs without abdominal surgery
  - review patient medications (especially opiates)
  - measure serum electrolyte to monitor for electrolyte abnormalities (including extended lytes like Mg, Ca\(^{2+}\), PO\(_4\))
  - CT scan to rule out abscess or peritoneal sepsis, or to exclude complete mechanical obstruction

Treatment
- most important: NPO + fluid resuscitation
- NGT decompression, correct causative abnormalities (e.g. sepsis, medications, electrolytes), consider TPN for prolonged ileus
- post-operative: gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
- current interest in novel therapies such as gum chewing and pharmacologic therapy (e.g. alvimopan, an opioid antagonists)

Intestinal Ischemia

Etiology
- acute
  - arterio-occlusive mesenteric ischemia (AOMI)
    - thrombotic, embolic, extrinsic compression (e.g. strangulating hernia)
  - non-occlusive mesenteric ischemia (NOMI)
    - mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
    - mesenteric venous thrombosis (MVT)
      - consider hypercoagulable state (i.e. rule out malignancy), DVT (prevents venous outflow)
  - chronic: usually due to atherosclerotic disease – look for CVD risk factors
  - can lead to occlusion in vessels that supplies the small intestine and the large intestine

Figure 11. Appendix anatomy
Clinical Features
- acute: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, sepsis
- chronic: postprandial pain (from mesenteric angina), fear of eating, weight loss
- common sites: SMA supplied territory, “watershed” areas of colon – splenic flexure, left colon, sigmoid colon

Investigations
- laboratory: leukocytosis (non-specific), lactic acidosis (late finding)
  - amylase, lactate, CK, ALP can be used to observe progress
  - hypercoagulability workup if suspect venous thrombosis
- AXR: portal venous gas, intestinal pneumatosis, free air if perforation
- contrast CT: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, pneumatosis
- CT angiography is the gold standard for acute arterial ischemia

Treatment
- fluid resuscitation, correct metabolic acidosis, NPO, NGT decompression of stomach, prophylactic broad-spectrum antibiotics, avoid vasoconstrictors and digitalis
- exploratory laparotomy
- angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, percutaneous transluminal angioplasty ± stent
- segmental resection of necrotic intestine
- assess extent of viability; if extent of bowel viability is uncertain, a second look laparotomy 12-24 h later is mandatory

Tumours of Small Intestine

BENIGN TUMOURS
- 10x more common than malignant
- usually asymptomatic until large
- most common sites: terminal ileum, proximal jejunum
- polyps
  - adenomas
  - hamartomas
- FAP (see Familial Colon Cancer Syndromes, GS33)
- juvenile polyps
- other: leiomyomas, lipomas, hemangiomas

Table 8. Malignant Tumours of the Small Intestine

### Short Gut Syndrome

**Definition**
- reduced surface area (length) of small bowel causing insufficient intestinal absorption leading to diarrhea, malnutrition, and dehydration

**Risk Factors**
- acute mesenteric ischemia: resection of large amount of bowel at once
- Crohn’s disease: cumulative resections
- malignancies

**Prognostic Factors**
- residual small bowel length, residual colon length (reabsorption of water and electrolytes and some reabsorption of nutrients), condition of the remnant small bowel (healthier bowel facilitate better reabsorption), presence of ileoceleal valve (delay transition into colon leading to more reabsorption)
- resection of ileum is less tolerated than resection of jejunum (ileum reabsorbs bile salt and vitamin B12)

**Therapy**
- medical
  - TPN: replenish lost fluid and electrolytes in diarrhea
  - HT2R antagonist or PPI to prevent gastric acid secretion
  - antimotility agent to prolong transit time in the small intestine
  - consider octreotide to decrease GI secretion & cholystryramine for bile acid absorption
- surgical: non-transplant
  - to slow transit time: small bowel segmental reversal, intestinal valve construction, or electrical pacing of small bowel
  - to increase intestinal length:
    - LIIT (longitudinal intestinal lengthening and tailoring) procedure
    - STEP (serial transverse enteroplasty procedure) in dilated small bowels
- surgical: transplant
  - indication: life-threatening complication from intestinal failure or long-term TPN
  - liver failure, thrombosis of major central veins, recurrent catheter-related sepsis, recurrent severe dehydration

### Abdominal Hernia

- see Hiatus Hernia, GS13

**Definition**
- defect in abdominal wall causing abnormal protrusion of intra-abdominal contents

**Epidemiology**
- M:F = 9:1
- lifetime risk of developing a hernia: males 20-25%, females 2%
- frequency of occurrence: 50% indirect inguinal, 25% direct inguinal, 8-10% incisional (ventral), 5% femoral, 3-8% umbilical
- most common surgical disease of males

**Risk Factors**
- activities which increase intra-abdominal pressure
  - obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, heavy lifting
- congenital abnormality (e.g. patent processus vaginalis, indirect inguinal hernia)
- previous hernia repair, especially if complicated by wound infection
- loss of tissue strength and elasticity (e.g. hiatus hernia, aging, repetitive stress)
Clinical Features
• mass of variable size
• tenderness worse at end of day, relieved with supine position or with reduction
• abdominal fullness, vomiting, constipation
• transmits palpable impulse with coughing or straining

Investigations
• physical examination usually sufficient
• US ± CT (CT required for obturator hernias, internal abdominal hernias, and Spigelian and/or femoral hernias in obese patients)

Classification
• complete: hernia sac and contents protrude through defect
• incomplete: partial protrusion through the defect
• internal hernia: sac herniating into or involving intra-abdominal structure
• external hernia: sac protrudes completely through abdominal wall
• strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
  • requires emergency repair
• incarcerated hernia: irreducible hernia, not necessarily strangulated
• Richter’s hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
• a strangulated Richter’s hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
• sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)

Anatomical Types
• groin
  • indirect and direct inguinal, femoral
  • pantaloon: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
• epigastric: defect in linea alba above umbilicus
• incisional: ventral hernia at site of wound closure, may be secondary to wound infection
• other: Littre’s (involving Meckel’s), Amyand’s (containing appendix), lumbar, obturator, peristomal, umbilical, Spigelian (ventral hernia through linea semilunaris)

Complications
• incarceration
• strangulation
• small, new hernias more likely to strangulate
• femoral >> indirect inguinal > direct inguinal
• intense pain followed by tenderness
• intestinal obstruction, gangrenous bowel, sepsis
• surgical emergency
• DO NOT attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous
• will cause closed loop SBO – and EMERGENCY

Treatment
• surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis; if asymptomatic can delay surgery
• repair may be done open or laparoscopic and may use mesh for tension-free closure
• most repairs are now done using tension free techniques – a plug in the hernial defect and a patch over it or patch alone
• observation is acceptable for small asymptomatic inguinal hernias

Post-Operative Complications
• recurrence (15-20%)
  • risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-operative functional status (ASA ≥ 3 – see Anesthesia and Perioperative Medicine, A4), associated medical conditions: type 2 DM, hyperlipidemia, immunosuppression, any comorbid conditions increasing intra-abdominal pressure
  • less common with mesh/”tension-free” repair
• scrotal hematoma (3%)
• painful scrotal swelling from compromised venous return of testes
• deep bleeding: may enter retroperitoneal space and not be initially apparent
• difficulty voiding
• nerve entrapment
• ilioinguinal (causes numbness of inner thigh or lateral scrotum)
• genital branch of genitofemoral (in spermatic cord)
• stenosis/occlusion of femoral vein
• acute leg swelling
• ischemic colitis

Outcomes of Laparoscopic vs. Open Repair of Primary Ventral Hernias
Purpose: To compare outcomes (surgical site infection (SSI), hernia recurrence and bulging) of patients undergoing laparoscopic ventral hernia repair (LVRH) versus open ventral hernia repair (OVHR).
Results/Conclusions: 79 patients with LVRH matched to 79 patients with OVHR with mesh with a median follow-up of 56 mo. UHRH was associated with fewer SSIs (7.6% vs. 34.1%) but more cases of bulging (21.5% vs. 1.2%) and port-site hernia (2.5% vs. 0.0%). No differences in recurrence were observed.

McBurney’s Sign
Tenderness 1/3 the distance from the ASIS to the umbilicus on the right side

Appendix

Appendicitis

Epidemiology
• 6% of population, M>F
• 80% between 5-35 yr of age

Pathogenesis
• luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
• etiology
  ▪ children or young adult: hyperplasia of lymphoid follicles, initiated by infection
  ▪ adult: fibrosis/stricture, fecolith, obstructing neoplasm
  ▪ other causes: parasites, foreign body

Clinical Features
• most reliable feature is progression of signs and symptoms
• low grade fever (38°C), rises if perforation
• abdominal pain then anorexia, N/V
• classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney’s point
  ▪ due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
  ▪ McBurney’s sign
• signs
  ▪ inferior appendix: McBurney’s sign (see sidebar), Rovsing’s sign (palpation pressure to left abdomen causes McBurney’s point tenderness).
  ▪ McBurney’s sign is present whenever the opening of the appendix at the cecum is directly under McBurney’s point; therefore McBurney’s sign is present even when the appendix is in different locations
  ▪ retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
  ▪ pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)
• complications
  ▪ perforation (especially if >24 h duration)
  ▪ abscess, phlegmon
  ▪ sepsis

*see Basic Anatomy Review, Figure 2, GS3

<tr>
<td>Roof: intercrural fibres</td>
<td>Inferior border: inguinal ligament</td>
</tr>
</tbody>
</table>

*see Basic Anatomy Review, Figure 2, GS3

Epidemiology
• 80% between 5-35 yr of age
Investigations
- laboratory
  - mild leukocytosis with left shift (may have normal WBC counts)
  - higher leukocyte count with perforation
  - β-hCG to rule out ectopic pregnancy
  - urinalysis
- imaging
  - U/S may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but CANNOT rule out appendicitis (if >6 mm, SENS/SPEC/PPV/PNP 98%)
  - =CT scan: thick wall, appendicolith, inflammatory changes – overall accuracy 94-100%, optimal investigation

Treatment
- hydrate, correct electrolyte abnormalities
- appendectomy (gold standard)
  - laparoscopic vs. open (see sidebar)
- complications: intra-abdominal abscess, appendiceal stump leak
- perioperative antibiotics:
  - cefazolin + metronidazole if uncomplicated peri-operative dose is adequate
  - consider treatment with post-operative antibiotics for perforated appendicitis
- for patients who present with an abscess (palpable mass or phlegmon on imaging and often delayed diagnosis with symptoms for >4-5 d), consider radiologic drainage + antibiotics x 14 d ± interval appendectomy once inflammation has resolved = (controversial)
- recent research supports antibiotic only treatment as reasonable for uncomplicated appendicitis, with 10-20% recurrence rates
- colonoscopy in the elderly to rule out other etiology (neoplasm)

Prognosis
- mortality rate: 0.08% (non-perforated), 0.5% (perforated appendicitis)

Inflammatory Bowel Disease

- see Gastroenterology, G19

Principles of Surgical Management
- can alleviate symptoms, address complications, improve quality of life
- conserve bowel: resect as little as possible to avoid short gut syndrome
- perioperative management
  - optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
  - hold immunosuppressive therapy pre-operative, provide pre-operative stress dose of corticosteroid if patient had recent steroid therapy, taper steroids post-operative
  - VTE prophylaxis: LMWH or heparin (IBD patients at increased risk of thromboembolic events)

Crohn’s Disease

- see Gastroenterology, G20

Treatment
- surgery is for symptom management, it is NOT curative, but over lifetime ~70% of Crohn’s patients will have surgery
- indications for surgical management
  - failure of medical management
  - SBO (due to stricture/inflammation): indication in 50% of surgical cases
  - abscess, fistula (enterocolic, vesicular, vaginal, cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), perianal disease
- surgical procedures
  - resection and anastomosis/stoma if active or subacute inflammation, perforation, fistula
  - resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
  - stricturoplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

Complications of Treatment
- short gut syndrome (diarrhea, steatorrhea, malnutrition)
- fistulas
- gallstones (if terminal ileum resected, decreased bile salt resorption → increased cholesterol precipitation)
- kidney stones (loss of calcium in diarrhea → increased oxalate absorption and hyperoxaluria → stones)
Prognosis
- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), stricturoplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr

Ulcerative Colitis
- see Gastroenterology, G21

Treatment
- indications for surgical management
  - failure of medical management (including inability to taper steroids)
  - complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
  - reduce cancer risk (1-2% risk per yr after 10 yr of disease)
- surgical procedures
  - proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
  - proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
  - colectomy and IPAA ± rectal mucosectomy
  - in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

Complications of Treatment
- early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomotic leak
- late: stricture, anal fistula/abscess, pouchnitis, poor anorectal function, reduced fertility

Prognosis
- mortality: 5% over 10 yr
- total proctocolectomy will eliminate risk of cancer
- perforation of the colon is the leading cause of death from ulcerative colitis

LARGE INTESTINE

Large Bowel Obstruction

Mechanical Large Bowel Obstruction

Etiology

<td>Radiation stricture</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Clinical Features (unique to LBO)
- open loop (10-20%)
  - incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical presentation similar to SBO
- closed loop (80-90%) (dangerous)
  - competent ileocecal valve, resulting in proximal and distal occlusions
  - massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

Treatment
- surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
- volvulus requires sigmoidoscopic or endoscopic decompression followed by operative reduction if unsuccessful
  - if successful, consider interval sigmoid resection on same admission
- cecal volvulus can be a true volvulus or a cecal 'bascule' (cecum folds anteriorly to the ascending colon producing a flap valve occlusion to cecal emptying) – both need surgical treatment
Prognosis
- overall mortality: 10%
- cecal perforation + feculent peritonitis: 20% mortality

</tr>
</tbody>
</table>

Functional LBO: Colonic Pseudo-Obstruction (Ogilvie’s Syndrome)

Definition
- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel

Associations
- most common: trauma, infection, cardiac (MI, CHF)
- disability (long-term debilitation, chronic disease, bed-bound nursing home patients, paraplegia), drugs (narcotic use, laxative abuse, polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, diffuse carcinomatosis)

Clinical Features
- most prominent is abdominal distention (acute or graduate over 3-7 days)
- abdominal pain, nausea and vomiting, constipation/diarrhea
- watch out for fever, leukocytosis, and presence of peritoneal signs

Investigations
- AXR: cecal dilatation – if diameter ≥12 cm, increased risk of perforation

Treatment
- treat underlying cause
- NPO, NGT
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia, or failure of conservative management

Prognosis
- most resolve with conservative management
Diverticular Disease

Definitions
- diverticulum: abnormal sac-like protrusion from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided

![TRUE DIVERTICULUM (full wall thickness)](mucosa)
![FALSE DIVERTICULUM (mucosal herniations)](circular muscle)

Figure 13. Diverticular disease – cross-sections of true and false diverticuli

Diverticulosis

Epidemiology
- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

Pathogenesis
- risk factors
  - lifestyle: low-fibre diet (predispose to motility abnormalities and higher intraluminal pressure), inactivity, obesity
  - muscle wall weakness from aging and illness (e.g. Ehler-Danlos, Marfan’s)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

Clinical Features
- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications
  - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
  - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive LGIB
  - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, abdominal pain

Treatment
- uncomplicated diverticulosis: high fibre, education
- diverticular bleed
  - initially workup and treat as any LGIB
  - if hemorrhage does not stop, resect involved region

Diverticulitis

Epidemiology
- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

Pathogenesis
- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula, or obstruction can ensue
- poor containment results in free perforation and peritonitis
Clinical Features
- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, N/V, urinary symptoms (with adjacent inflammation)
- complications (25% of cases)
  - abscess: palpable tender abdominal mass
  - fistula: colovesical (most common), coloenteric, colovaginal, colocutaneous
  - colonic obstruction: due to scarring from repeated inflammation
  - perforation: generalized peritonitis (feculent vs. purulent)
    - recurrent attacks rarely lead to peritonitis
- low-grade fever, mild leukocytosis common, occult or gross blood in stool rarely coexist with acute diverticulitis

Investigations
- AXR, upright CXR
  - localized diverticulitis (ileus, thickened wall, SBO, partial colonic obstruction)
  - free air may be seen in 30% with perforation and generalized peritonitis
- CT scan (test of choice): very useful for assessment of severity and prognosis; usually done with rectal contrast
  - 97% sensitive, 99% specific
  - increased soft tissue density within pericolic fat secondary to inflammation, diverticula secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), fistula
  - 10% of diverticulitis cannot be distinguished from carcinoma
- elective evaluation: establish extent of disease and rule out other diagnoses (polyps, malignancy)
  - colonoscopy or barium enema and flexible sigmoidoscopy

Treatment
- uncomplicated: conservative management
- outpatient: clear fluids only until improvement and antibiotics (e.g. cefazolin and metronidazole) 7-10 d to cover gram negative rods and anaerobes (e.g. B. fragilis)
- hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, fail to improve outpatient management
- treat with NPO, IV, IV antibiotics (e.g. IV ceftriaxone + metronidazole)
- indications for surgery
  - unstable patient with peritonitis
  - Hinchey stage 3-4
  - after 1 attack if immunosuppressed
- consider if recurrent episodes of diverticulitis (3 or more), recent trend is toward conservative management of recurrent mild/moderate attacks
- complications: perforation, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
- surgical procedures
  - for unstable patient or complex cases: Hartmann procedure
    - colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo
  - for more stable patients with Hinchey stage III and IV acute diverticulitis, colonic resection, primary anastomosis + diverting loop ileostomy is becoming more common, with benefits for mortality and morbidity
- laparoscopic peritoneal lavage with drain placement near the affected colon, in addition to IV antibiotics (NO resection) has been proposed for Hinchey stage III

Prognosis
- mortality rates: 6% for purulent peritonitis, 35% for feculent peritonitis
- recurrence rates: 13-30% after first attack, 30-50% after second attack

Colorectal Neoplasms

Colorectal Polyps

Definition
- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk)

Epidemiology
- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70

Clinical Features
- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, mucus
- usually detected during routine endoscopy or familial/high risk screening

Pathology
- non-neoplastic
  - hyperplastic: most common non-neoplastic polyp
  - mucosal polyps: small <5 mm, no clinical significance
  - inflammatory pseudopolyps: associated with IBD, no malignant potential
  - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, carcinoids
- neoplastic
  - lipomas, leiomyomas, carcinoids
  - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
    - malignant risk due to associated adenomas (large bowel)
  - low malignant potential → most spontaneously regress or autoamputate
  - adenomas: premalignant, considered carcinoma in situ IF high grade dysplasia
    - some may contain invasive carcinoma ("malignant polyp" – 3-9%): invasion into submucosa
      - malignant potential: villous > tubulovillous > tubular

</table>

Investigations
- colonoscopy is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscopy if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

Treatment
- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- indications for segmental resection for malignant polyps: 1) lymphovascular invasion; 2) tumour budding; 3) positive resection margin; 4) poorly differentiated cells; 5) evidence of regional or distant metastases on staging. Most of these cases are usually discussed at multi-disciplinary tumour boards
- follow-up endoscopy 1 yr later, then every 3-5 yr

Familial Colon Cancer Syndromes

FAMILIAL ADENOMATOUS POLYPOSIS

Pathogenesis
- autosomal dominant inheritance, mutation in adenomatous polyposis coli (APC) gene on chromosome 5q21
Clinical Features

- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
- extracolonic manifestations
  - carcinoma of small bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, small bowel
  - congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
  - virtually 100% lifetime risk of colon cancer (because of number of polyps)
- variants
  - Gardner’s syndrome: FAP + extra-intestinal lesions (sebaceous cysts, osteomas, desmoid tumours)
  - Turcot syndrome: FAP + CNS tumours (childhood cerebellar medulloblastoma)

Investigations

- genetic testing (80-95% sensitive, 99-100% specific)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery (see Figure 14); consider upper endoscopy to evaluate for periampullary tumours

Treatment

- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

HEREDITARY NON-POLYPOSIS COLORECTAL CANCER – LYNCH SYNDROME

Pathogenesis

- autosomal dominant inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1) resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

Clinical Features

- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr, lifetime risk 70-80% (M>F)
- HNPCC I: hereditary site-specific colon cancer
- HNPCC II: cancer family syndrome – high rates of extracolonic tumours (endometrial, ovarian, hepatobiliary, small bowel)

Diagnosis

- Amsterdam Criteria
  - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
  - 2 or more generations involved
  - 1 case must be diagnosed before 50 yr old
  - FAP is excluded
- genetic testing (80% sensitive) – colonoscopy mandatory even if negative
  - refer for genetic screening individuals who fulfill EITHER the Amsterdam Criteria OR the revised Bethesda Criteria
- colonoscopy (starting age 20) annually
- surveillance for extracolonic lesions

Treatment

- total colectomy and ileorectal anastomosis with annual proctoscopy

Colorectal Carcinoma

Epidemiology

- 4th most common cancer (after lung, prostate, and breast), 2nd most common cause of cancer death

Risk Factors

- most patients have no specific risk factors
- age >50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, family history of CRC
- colonic conditions
  - adenomatous polyps (especially if >1 cm, villous, multiple)
  - IBD (especially UC: risk is 1-2%/yr if UC >10 yr)
  - previous colorectal cancer (also gonadal or breast)
  - diet (increased fat, red meat, decreased fibre) and smoking
  - DM and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)
Pathogenesis
- adenoma-carcinoma sequence; rarely arise de novo

Clinical Features
- often asymptomatic
- hematochezia/melena, abdominal pain, change in bowel habits
- others: weakness, anemia, weight loss, palpable mass, obstruction
- 20% patients have distant metastatic disease at time of presentation
- spread
  - direct extension, lymphatic, hematogenous (liver most common, lung, bone, brain; tumour of distal rectum → IVC → lungs)
  - peritoneal seeding: ovary, Blumer's shelf (pelvic cul-de-sac)

### Table 15. Clinical Presentation of CRC

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Pathology</th>
<th>Signs</th>
</tr>
</thead>
<tbody>
<tr>
<td>25%</td>
<td>Exophytic lesions with occult bleeding</td>
<td>Weight loss, weakness, rarely obstruction</td>
</tr>
<tr>
<td>35%</td>

<td>Constipation → overflow (alternating bowel patterns), abdominal pain, decreased stool calibre, rectal bleeding</td>
</tr>
<tr>
<td>30%</td>
<td>Ulcerating</td>
<td>Obstruction, tenesmus, rectal bleeding</td>
</tr>
</tbody>
</table>

Investigations
- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema (“apple core” lesion) + sigmoidoscopy
- laboratory: CBC, urinalysis, liver enzymes, liver function tests, carcinogenic embryonic antigen (CEA)
  - (pre-operative for baseline, >5 ng/mL have worse prognosis)
- staging: CT chest/abdomen/pelvis; bone scan, CT head only if lesions suspected
- rectal cancer: pelvic MRI or endorectal U/S to determine T and N stage
- other: weakness, anemia, weight loss, palpable mass, obstruction

### Table 16. TNM Classification System for Staging of Colorectal Carcinoma (AJCC/UICC 2010)

</tbody>
</table>

### Treatment

- colon cancer
  - wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
  - curative: wide resection of lesion (5 cm margins) with nodes (>12) and mesentery
  - metastatic lesions confined to the liver can be resected with curative intent
  - palliative: if distant spread, local control for hemorrhage or obstruction
  - care is taken to not spread tumour by unnecessary palpation
  - cancer-bearing portion of colon is removed according to vascular distribution of segment
  - adjuvant chemotherapy (5-FU or oral capcitabine with oxaliplatin) for stage III and is considered in select stage II patients
- rectal cancer
  - choice of operation depends on individual case; types of operations
  - low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins (~2cm); uses technique of total mesorectal excision
  - abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
  - transanal minimally invasive surgery (TAMIS)- local excision for select T1 lesions only
  - palliative procedures involve proximal diversion with an ostomy for obstruction and radiation for bleeding or pain
  - adjuvant therapy
  - combined neoadjuvant chemoradiation therapy followed by post-operative adjuvant chemotherapy for stages II and III

---

**Figure 16. APR vs. LAR**

5-yr Survival Rates for CRC
- Colon
- Rectum
- Stage I: 74% vs. 74%
- Stage II: 67% vs. 64%
- Stage III: 59% vs. 52%
- Stage IV: 37% vs. 32%
- Stage IIIA: 73% vs. 74%
- Stage IIIB: 46% vs. 45%
- Stage IIIC: 28% vs. 33%
- Stage IV: 6% vs. 6%

**Conclusion:**
- There is long-term reduction in local recurrence of stage II rectal cancer with pre-operative chemotherapy, but no improvement in overall survival or distant recurrence of disease.

**Methods:**
- Patients with stage II to III rectal cancer (n = 799) were randomly assigned to pre-operative (n = 400) or post-operative CRT (n = 399) with fluorouracil (5-FU), radiation, and adjuvant FU chemotherapy, in addition to total mesorectal excision surgery. Follow-up was designed to assess long-term overall survival as the primary end point, and cumulative incidence of local and distant relapses and disease-free survival as secondary end points.

**Results:**
- 10-yr incidence of local relapse was significantly lower in the pre-operative CRT group than in the post-operative group (7.1% vs. 10.1%, p = 0.0048).
- Overall survival at 10 yr was similar at ~60% for patients treated with pre-operative or post-operative CRT (p = 0.08). Disease-free survival rates at 10 yr were similar at ~88% for patients treated with pre-operative or post-operative CRT (p = 0.56). No significant difference was detected for 10-yr incidence of distant metastases (pre-operative CRT 28.9% vs. post-operative CRT 25.6%, p = 0.18).
- Conclusion: There is long-term reduction in local recurrence of stage II to III rectal cancer with pre-operative chemotherapy, but no improvement in overall survival or distant recurrence of disease.
Follow-Up
• currently there are no data suggesting optimal follow-up
• combination of periodic CT chest/abdomen/pelvis, CEA, and colonoscopy is recommended
• CEA to monitor for initial response to treatment, and for surveillance (q6months)

Other Conditions of the Large Intestine

Angiodysplasia

Definition
• vascular anomaly: focal submucosal venous dilatation and tortuosity

Clinical Features
• most frequently in right colon of patients >60 yr old
• bleeding typically intermittent, rarely massive, not usually hypotensive (melena, anemia, guaiac positive stools)

Investigations
• colonoscopy: cherry red spots, branching pattern from central vessel
• angiography: early-filling vein, vascular tuft, delayed emptying vein; rarely active bleeding
• RBC technetium-99 scan
• barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

Treatment
• none if asymptomatic
• cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

Volvulus

Definition
• rotation of segment of bowel about its mesenteric axis
• sigmoid (65%), cecum (30%), transverse colon (3%), splenic flexure (2%)
• 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

Risk Factors
• age (30% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
• high fibre diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, institutionalization (less frequent evacuation of bowels)
• congenital hypermobile cecum

Clinical Features
• symptoms due to bowel obstruction (see Large Bowel Obstruction, GS29) or intestinal ischemia (see Intestinal Ischemia, GS23)
• colicky abdominal pain, persistence of pain between spasms, abdominal distention, vomiting

Investigations
• AXR (classic findings): “omega”, “bent inner-tube”, “coffee-bean” signs
• barium/Gastrografin enema: “ace of spades” or “bird’s beak” appearance due to funnel-like luminal tapering of lower segment towards volvulus
• sigmoidoscopy or colonoscopy as appropriate
• CT

Treatment
• initial supportive management (same as initial management for bowel obstruction (see Large Bowel Obstruction, GS29)
• cecum
  • nonsurgical
    • may attempt colonoscopic detorsion and decompression
  • surgical
    • right colectomy + ileotransverse colonic anastomosis
• sigmoid
  • nonsurgical
    • decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
    • subsequent elective surgery recommended (50-70% recurrence)
  • surgical: Hartmann procedure (if urgent)
    • indications: strangulation, perforation, or unsuccessful endoscopic decompression
Toxic Megacolon

Pathogenesis
- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

Etiology
- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (C. difficile, Salmonella, Shigella, Campylobacter), viral (cytomegalovirus), parasitic (E. histolytica)

Clinical Features
- infectious colitis usually presents for >1 wk before colonic dilatation
- diarrhea ± blood (but improvement of diarrhea may portend onset of megacolon)
- abdominal distention, tenderness, ± local/general peritoneal signs (suggest perforation)
- triggers: hypokalemia, constipating agents (opioids, antidepressants, loperamide, anticholinergics), barium enema, colonoscopy

Diagnostic Criteria
- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- three of: fever, HR >120, WBC >10.5, anemia
- one of: fluid and electrolyte disturbances, hypotension, altered LOC

Investigations
- CBC (leukocytosis with left shift, anemia from bloody diarrhea), electrolytes, elevated CRP, ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

Treatment
- NPO, NGT, stop constipating agents, correct fluid and electrolyte abnormalities, transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis, anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD, metronidazole for C. difficile)
- indications for surgery (50% improve on medical management)
- worsen in other toxicity or dilation after 48-72 h
- severe hemorrhage, perforation
- high lactate and WBC especially for C. difficile
- procedure: subtotal colectomy + end ileostomy (may be temporary, with second operation for re-anastomosis later)

Prognosis
- average 25-30% mortality

Fistula

Definition
- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, entero-enteric)

Etiology
- foreign body erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD [especially Crohn's], diverticular disease)
- iatrogenic/surgery (e.g. post-operative anastomotic leak, radiation)
- congenital, trauma
- neoplastic

Investigations
- U/S, CT scan, fistulogram
- measure amount of drainage from fistula

Treatment
- decrease secretion: octreotide/somatostatin/omeprazole
- surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis
Stomas

Definition
• an opening of the GI tract onto the surface of the abdomen wall
  • stomas can be constructed as either end stomas: the proximal end of the GI tract forms the stoma and the distal end of the GI tract is not part of the stoma, or loop stomas: a loop of the GI tract is brought up to the skin and the anti-mesenteric surface of the bowel is matured as a stoma. The proximal and distal GI tract remain in continuity

Ileostomy
• usually positioned in RLQ; ileum is brought through rectus abdominus muscles
• indications: after protocolectomy for ulcerative colitis, in some cases of Crohn’s disease or familial polyposis
• conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
• continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

Colostomy
• indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
• colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
• most common permanent colostomy is a sigmoid colostomy – expels stool once per day, no appliance required
• chronic paracolostomy hernia is a common complication

Complications (10%)
• obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
• peri-ileostomy abscess and fistula
• skin irritation
• prolapse or retraction
• diarrhea (excessive output)

Figure 17. Ostomies

Hemorrhoids

Etiology
• vascular and connective tissue complexes form a plexus of dilated veins (cushion)
• internal: superior hemorrhoidal veins, above dentate line, portal circulation
• external: inferior hemorrhoidal veins, below dentate line, systemic circulation

Risk Factors
• increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal HTN, heavy lifting

Figure 19. Hemorrhoids
**Clinical Features and Treatment**

- **internal hemorrhoids**
  - engorged vascular cushions usually at 3, 7, 11 o’clock positions (patient in lithotomy position)
  - **PAINLESS** rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, rectal fullness
    - 1st degree: bleed but do not prolapse through the anus
      - treatment: high fibre/bulk diet, sitz baths, steroid cream, paroxine (Anusol™), rubber band ligation, sclerotherapy, photocoagulation
    - 2nd degree: bleed, prolapse with straining, spontaneous reduction
      - treatment: rubber band ligation, photocoagulation
    - 3rd degree: bleed, prolapse, requires manual reduction
      - treatment: same as 2nd degree, but may require closed hemorrhoidectomy
    - 4th degree: bleed, permanently prolapsed, cannot be manually reduced
      - treatment: closed hemorrhoidectomy
  - **external hemorrhoids**
    - dilated venules usually mildly symptomatic
    - **PAIN** after bowel movement, associated with poor hygiene
    - medical treatment: dietary fibre, stool softeners, steroid cream (short course), paroxine (Anusol™), avoid prolonged straining
    - thrombosed hemorrhoids are very painful
    - resolve within 2 wk, may leave excess skin = perianal skin tag
    - treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

<table>
<thead>
<tr>
<th>Internal Hemorrhoids</th>
<th>External Hemorrhoids</th>

<td></td>
</tr>
</tbody>
</table>

**Table 17. Signs and Symptoms of Internal vs. External Hemorrhoids**

**Anal Fissures**

**Definition**
- tear of anal canal below dentate line (very sensitive squamous epithelium)
- 90% posterior midline, 10% anterior midline
- if off midline: consider other possible causes such as IBD, STIs, TB, leukemia, or anal carcinoma
- repetitive injury cycle after first tear
  - sphincter spasm occurs preventing edges from healing and leads to further tearing
  - ischemia may ensue and contribute to chronicity

**Etiology**
- forceful dilation of anal canal: large, hard stools and irritant diarrheal stools
- tightening of anal canal secondary to nervousness/pain leads to further tearing
- others: habitual use of cathartics, childbirth

**Clinical Features**
- **acute fissure**
  - very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
  - treatment is conservative: stool softeners, bulking agent, sitz baths (heals 90%)
  - triad: fissure, sentinel skin tags, hypertrophied papillae
  - treatment
    - stool softeners, bulking agents, sitz baths
    - topical nitroglycerin or nifedipine: increases local blood flow, promoting healing and relieves sphincter spasm
    - lateral internal anal sphincterotomy (most effective): objective is to relieve sphincter spasm → increases blood flow and promotes healing; but 5% chance of fecal incontinence therefore not commonly done
    - alternative treatment
      - botulinum toxin: inhibits release of acetylcholine (ACh), reducing sphincter spasm
### Anorectal Abscess

**Definition**
- infection in one or more of the anal spaces
- usually bacterial infection of blocked anal gland at the dentate line
- *E. coli, Proteus, Streptococci, Staphylococci, Bacteroides, anaerobes*

**Clinical Features**
- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralevator), or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

**Treatment**
- I&D
  - curative in 50% of cases
  - 50% develop anorectal fistulas
  - may require antibiotics if diabetic, heart murmur, or cellulitis

### Fistula-In-Ano

**Definition**
- anal fistula from rectum to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

**Etiology**
- see Fistula, GS37
- same perirectal process as an anal abscess, therefore usually associated with an abscess
- other causes: post-operative, trauma, anal fissure, malignancy, radiation proctitis

**Clinical Features**
- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

**Treatment**
- identification
  - internal opening
    - Goodsall’s rule
      - fistulas originating anterior to a transverse line through the anus will have a straight course and exit anteriorly, whereas those originating posterior to the transverse line will begin in the midline and have a curved tract
  - fistulous tract
    - probing or fistulography under anesthesia

---

Recurrent perianal abscesses is associated with Crohn’s disease

Antibiotics are not typically helpful in the treatment of perianal abscesses
• surgery
  ■ fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
  ■ low lying fistula (does not involve external sphincter) → primary fistulotomy
  ■ high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract
    • promotes drainage
    • promotes fibrosis and decreases incidence of incontinence
    • delineates anatomy
    • usually done to spare muscle cutting

Post-Operative
• sitz baths, irrigation, and packing to ensure healing proceeds from inside to outside

Complications
• recurrence
• rarely fecal incontinence

**Pilonidal Disease**

**Definition**
• chronic recurring abscess or chronic draining sinus in sacrococcygeal area

**Epidemiology**
• occurs most frequently in young men age 15-40 yr; rare in >50 yr

**Etiology**
• obstruction of the hair follicles in this area → formation of cysts, sinuses, or abscesses

**Clinical Features**
• asymptomatic until acutely infected, then pain/tenderness, purulent discharge, inspissated hair

**Treatment**
• acute abscess
  ■ I&D (often performed by primary care doctors)
  ■ wound packed open
  ■ 40% develop chronic pilonidal sinuses
• surgery
  ■ indication: failure of healing after I&D, recurrent disease, complex disease
  ■ pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

**Rectal Prolapse**

**Definition**
• protrusion of some or all of rectal mucosa through external anal sphincter

**Epidemiology**
• extremes of ages: <5 yr old and >5th decade
  ■ 85% women

**Etiology**
• lengthened attachment of rectum secondary to constant straining
  • 2 types
  1. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
  2. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
    • first degree: prolapse includes mucocutaneous junction
    • second degree: without involvement of mucocutaneous junction
    • third degree (internal intussusception): prolapse is internal, concealed, or occult

**Risk Factors**
• gynecological surgery
• chronic neurologic/psychiatric disorders affecting motility
Clinical Features
- extrusion of mass with increased intra-abdominal pressure
  - straining, coughing, laughing, Valsalva
- difficulty in bowel regulation
  - tenesmus, constipation, fecal incontinence
- permanently extruded rectum with excoriation, ulceration, and constant soiling
- may be associated with urinary incontinence or uterine prolapse

Treatment
- Type I
  - conservative: gentle manual reduction of prolapsed area, especially in children
  - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II
  - conservative: reduce if possible
  - surgery: abdominal, perineal, transsacral approaches

Anal Neoplasms

ANAL CANAL

Squamous Cell Carcinoma of Anal Canal (Above Dentate Line)
- most common tumour of anal canal (75%)
- anus prone to human papillomavirus (HPV) infection, therefore at risk for anal squamous intra-epithelial lesions (ASIL)
  - high grade squamous intra-epithelial lesion (HSIL) and low grade squamous intra-epithelial lesion (LSIL) terminology used
- clinical features: anal bleeding, pain, mass, ulceration, pruritus; 25% asymptomatic
- treatment: chemotherapy ± radiation ± surgery
- prognosis: 80% 5-yr survival

Malignant Melanoma of Anal Canal
- 3rd most common site for primary malignant melanoma after skin, eyes
- aggressive, distant metastases common at time of diagnosis
- treatment: wide excision or APR ± chemoradiation
- prognosis: <5% 5 yr survival

ANAL MARGIN
- clinical features and treatment as for skin tumours elsewhere
- squamous and basal cell carcinoma, Bowen’s disease (SCC in situ), and Paget’s disease
Liver Cysts

Table 18. Characteristics of Liver Cysts

<table>
<thead>
<tr>
<th>Description</th>

<tr>
<td>Treatment</td>
<td>Not required unless very large Monitor if &gt;4 cm</td>
<td>Only if symptomatic partial liver resection drainage</td>
<td>Complete excision of cysts liver transplant if cyst involves intrahepatic bile ducts (Caroll’s disease)</td>
<td>Albendazole (anti-helminthic) – cure up to 30% Surgical (risk of spillage into abdomen): Conservative: open endocystectomy or PAIR (Percutaneous Aspiration, Injection of protoscolicidal agent, Re-aspiration) Radical: partial heptectomy or total pericystectomy</td>
<td>All complex, multiloculated cysts (except echinococcal) should be excised because of malignancy risk</td>
</tr>
<tr>
<td>Complications</td>
<td>Intracytic hemorrhage</td>
<td>Bilary cirrhosis, portal HTN, rupture, cholangiocarcinoma Abnormal pancreatobiliary junction is associated with increased risk of malignancy</td>
<td>Inferior vena cava compression rupture can cause biliary colic, jaundice, cholangitis, pancreatitis, or anaphylactic reaction</td>
<td>Cystadenocarcinoma can invade adjacent tissues and metastasize</td>
<td></td>
</tr>
</tbody>
</table>

Liver Abscesses

Etiology
- types
- pyogenic (bacterial): most common etiology; most often polymicrobial – E. coli, Klebsiella, Proteus, Strep. milleri
- parasitic (amoebic): Entamoeba histolytica, Echinococcal cyst
- fungal: Candida
- sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

Clinical Features
- fever, malaise, chills, anorexia, weight loss, abdominal pain, nausea
- RUQ tenderness, hepatomegaly, jaundice

Investigations
- leukocytosis, anemia, elevated liver enzymes, echinococcal serology
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S, MRI

Treatment
- treat underlying cause
- bacterial abscesses generally will treat initially with antibiotics, and add surgical or percutaneous drainage and IV antibiotics for larger abscesses (initially ceftriaxone + metronidazole or piperacillin/tazobactam)
- consider potential source of sepsis (e.g. biliary source, infected tumour)

Prognosis
- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, malnutrition
Neoplasms

BENIGN LIVER NEOPLASMS

Hemangioma (cavernous)
- pathogenesis: most common benign hepatic tumour; results from malformation of angioblastic fetal tissue
- risk factors: F:M = 3:1
- clinical features
  - usually small and asymptomatic
  - consumptive coagulopathy if giant (in children)
- investigations
  - contrast CT (well-demarcated hypodense mass with peripheral enhancement on arterial phase with centripetal filling on delayed phases), U/S (homogenous hyperchoic mass), MRI
  - avoid biopsy: may result in hemorrhage
- treatment
  - usually none

Focal Nodular Hyperplasia
- pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at centre of nodule
- risk factors: female, age 20-50
- clinical features: asymptomatic, rarely grows or bleeds, no malignant potential
- investigations: central stellate scar on CT scan; MRI, biopsy may be required
- treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential)
  - if confirmed to be FNH → no treatment required

Adenoma
- definition: benign glandular epithelial tumour
- risk factors: female, age 20-50, estrogen (OCP pregnancy)
- clinical features: asymptomatic, 25% present with RUQ pain or mass, may present with bleeding
- investigations: CT (well-demarcated masses, often heterogeneous enhancement on arterial phase, isodense on venous phase without washout of contrast), U/S, MRI, biopsy often needed
- treatment
  - stop anabolic steroids or OCP
  - excise, especially if large (>5 cm), due to risk of transformation to hepatocellular carcinoma and spontaneous rupture/hemorrhage

MALIGNANT LIVER NEOPLASMS

Primary
- most commonly hepatocellular carcinoma (HCC) and cholangiocarcinomas
- others include angiosarcoma, hepatoblastoma, hemangiendothelioma, HCC
- epidemiology: 3rd leading cause of cancer death worldwide, 9th in United States; highest in Africa, China, Taiwan
- risk factors
  - chronic liver inflammation: cirrhosis from any cause, chronic hepatitis B (inherently oncogenic) and hepatitis C, hemochromatosis, α1-antitrypsin deficiency
  - medications: OCPS (3x increased risk), steroids
  - smoking, alcohol, Betel nuts
  - chemical carcinogens (aflatoxin, microcystin, vinyl chloride – associated with angiosarcoma)
- clinical features
  - RUQ discomfort, right shoulder pain
  - jaundice, weakness, weight loss, ± fever (if central tumour necrosis)
  - hepatomegaly, bruit, hepatic friction rub
  - ascites with blood (sudden intra-abdominal hemorrhage)
  - paraneoplastic syndromes – hypoglycemia, hypercalcemia, erythrocytosis, watery diarrhea
  - metastasis: lung, bone, brain, peritoneal seeding
- investigations
  - elevated ALP, bilirubin, and α-fetoprotein (80% of patients)
  - U/S (poorly-defined margins with internal echoes), triphasic CT (enhancement on arterial phase and washout on portal venous phase), MRI
  - liver enzyme and liver function tests: AST, ALT, ALP, bilirubin, albumin, INR
- treatment
  - cirrhosis is a relative contraindication to tumour resection due to decreased hepatic reserve
  - surgical: resection (10% of patients have resectable tumours)
  - liver transplant; may use bridging therapy while awaiting transplant
    - absolute contraindications: extrahepatic disease, vascular invasion
    - relative contraindications: dependent on liver transplant protocol based on staging criteria followed by transplant centre

<td></td>
</tr>
</tbody>
</table>
non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheter arterial chemoembolization (TACE), chemotherapy (consider sorafenib for HCC; pre-operative chemotherapy for hepatoblastoma is standard of care), radiotherapy

prognosis
- median survival: 6-20 mo
- 5 yr survival: all patients – 5%; patients undergoing complete resection – 11-40%

Secondary
- metastases to the liver are the most common malignant tumors found in the liver
- etiology
  - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, prostate
- treatment
  - depends on the primary cancer site and prognosis. Often liver metastases are a manifestation of Stage IV disease, and chemotherapy is indicated
  - metastasectomy may be appropriate for some cancers
  - hepatic resection: metastatic colorectal liver metastases is standard of care as part of multi-modality treatment that includes chemotherapy if complete resection of the primary cancer and metastases is possible
  - prognosis following liver resection for colorectal metastases is an overall survival of 30-60% at 5 yr

*leading cause in adults; **leading cause in children

Clinical Indications
- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially:
  - decompensated cirrhosis (ascites, esophageal variceal hemorrhage, spontaneous hepatic encephalopathy, coagulopathy, progressive jaundice, severe fatigue)
  - unresetable primary liver cancers
  - fulminant hepatic failure
  - end-stage liver disease with life expectancy <1 yr and if no other therapy is appropriate
  - suitable HCC not amenable to liver resection

Criteria for Transplantation
- Model for End-Stage Liver Disease (MELD): prognostic model to estimate 3 mo survival and disease severity if patient does not receive transplant; based on creatinine, bilirubin, INR; MELD scores from 6-40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: classification system to assess the prognosis and mortality of liver disease; patient must have ≥7 points (Class B)

Contraindications
- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr
- advanced cardiopulmonary disease
- active uncontrolled infection

Post-Operative Complications
- primary non-function (graft failure): urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: HTN, renal disease, DM, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

Prognosis
- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%

Liver Toronto Notes 2017

Secondary liver metastases are common in many cancers, with some studies showing a prevalence of 40-50% amongst patients with extrahepatic cancers. They commonly arise from breast, lung, and colorectal cancers. For metastases secondary to colorectal cancer, surgical resection offers the greatest likelihood of cure.

Living Liver Donors vs. Deceased Liver Donors
The right lobe of a living donor liver is transplanted into the recipient, whereas whole livers from deceased donors are transplanted orthotopically into the recipient.

Which Matters Most: Number of Tumours, Size of the Largest Tumour, or Total Tumour Volume?
Liver Transplant 2011;17:508-46
Purpose: To determine if the size and/or number of hepatocellular carcinoma (HCC) nodules predict disease recurrence and survival after liver transplantation.
Methods: Systematic review and meta-analysis.
Results: 74 studies were included for analysis. Patients beyond the Milan criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the UCSF criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the Milan criteria but within the UCSF criteria had reduced overall and disease-free survivals. Overall and disease-free survivals were reduced for patients with larger total tumour diameter, ≥10 cm vs. <10 cm and ≥8 cm vs. <8 cm, respectively. Similarly, patients with higher diameter of largest tumour nodule ≥3 cm vs. <3 cm had reduced overall survival and higher recurrence. Overall and disease-free survivals were reduced and recurrence higher for patients with tumour size ≥5 cm vs. <5 cm. Mixed results were found regarding number of tumour nodules.
Conclusion: Tumour size and volume are important factors in survival after liver transplantation.

Living Donor Liver Transplantation vs. Deceased Donor Liver Transplantation for Hepatocellular Carcinoma: Comparable Survival and Recurrence
Liver Transplant 2012;18:315-322
Purpose: To compare the overall survival and hepatocellular carcinoma (HCC) recurrence rates after living donor liver transplantation (LLT) versus deceased donor liver transplantation (DDLT) in a series of patients with HCC.
Methods: Study conducted between 1996 and 2009 at a single center. 345 patients with HCC undergoing liver transplantation included.
Results: The overall survival rates at 1, 3, and 5 yr did not significantly differ between the DDLT and DDLT (p=0.62). Disease-free survival at 1, 5, and 5 yr did not differ between the groups (p=0.62). The recurrence rates at 1, 3, and 5 yr also did not differ between the two groups (p=0.59).
Conclusion: LLT and DDLT lead to similar survival and recurrence rates.
Biliary Tract

Cholelithiasis

Definition
• the presence of gallstones

Pathogenesis
• imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
• excessive hepatic cholesterol secretion → bile salts and lecithin are “overloaded” → supersaturated cholesterol can precipitate and form gallstones
• North America: cholesterol stones (80%), pigment stones (20%)

Risk Factors
• cholesterol stones
  ■ obesity, age <50
  ■ estrogens: female, multiparity, OCPs
  ■ ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
  ■ terminal ileal resection or disease (e.g. Crohn’s disease)
  ■ impaired gallbladder emptying: starvation, TPN, DM
  ■ rapid weight loss: rapid cholesterol mobilization and biliary stasis
• pigment stones (contain calcium bilirubinate)
  ■ cirrhosis
  ■ chronic hemolysis
  ■ biliary stasis (strictures, dilation, biliary infection)
  ■ protective factors: statins, vitamin C, coffee, exercise

Risk Factors for Cholesterol Stones
4Fs
Fat
Female
Fertile
Forties

Clinical Presentation
• asymptomatic (80%)
  ■ most do NOT require treatment
  ■ consider cholecystectomy if: increased risk of malignancy (choledochal cysts, Caroli’s disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, immunosuppression
• biliary colic (10-25%)
• cholecystitis
• choledocholithiasis (8-15%)
• cholangitis
• gallstone pancreatitis (see Acute Pancreatitis, GS51)
• gallstone ileus (0.3-0.5%)
• other: empyema of the gallbladder, liver abscess, gallbladder perforation with bile peritonitis

Figure 25. Gallstone disease

</table>
Investigations
- Labs
  - CBC, LFTs, amylase, and lipase
- U/S: diagnostic procedure of choice
  - image for signs of inflammation, obstruction, localization of stones
  - 95% specific for detecting stones
  - signs: gallbladder wall thickening > 4 mm, edema (double-wall sign), gallbladder sludge, pericholecystic fluid, sonographic Murphy's sign
- HIDA scan
  - used less commonly
  - radiisotope technetium-99 injected into a vein is excreted in high concentrations into bile, allowing visualization of the biliary tree
  - does not visualize stones; diagnosis by seeing occluded cystic duct or CBD

Choledocholithiasis (suspected or confirmed)
- MRCP
  - visualization of ampullary region, biliary and pancreatic anatomy
- ERCP
  - CBD stones in periampullary region
  - complications: retained stones, ERCP pancreatitis (1-2%), pancreatic or biliary sepsis

Percutaneous Transhepatic Cholangiography
- percutaneous approach to the proximal biliary tree (i.e. intra-hepatic biliary system) via the hepatic parenchyma
- useful for proximal bile duct obstruction or when ERCP fails or not available
- requires prophylactic antibiotics
- contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, disease of right lower lung or pleura
- complications: bile peritonitis, chylothorax, pneumothorax, biliary sepsis, hemobilia

Biliary Colic

Pathogenesis
- gallstone transiently impacted in cystic duct, no infection

Clinical Features
- steady, severe dull pain in epigastrium or RUQ for minutes to hours (<6 h), crescendo-decrescendo pattern
- may present with chest pain
- N/V
- frequently occurs at night or after fatty meal, not after fasting
- can radiate to right shoulder or scapula
- no peritoneal findings, no systemic signs

Investigations
- normal blood work: CBC, electrolytes, LFTs, bilirubin, amylase
- U/S shows choledolithiasis, may show stone in cystic duct

Treatment
- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success)
- complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, vessel injury
- laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
- risk of open cholecystectomy higher in emergency situations

Acute Cholecystitis

Pathogenesis
- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no choledolithiasis in 5-10% (see Acalculous Cholecystitis, GS48)

Clinical Features
- often have history of biliary colic
- severe constant (<6hr) epigastric or RUQ pain, anorexia, N/V, low grade fever (<38.5°C)
- focal peritoneal findings: Murphy's sign, palpable, tender gallbladder (in 33%)
- Boas' sign: right subscapular pain

Early vs. Delayed Laparoscopic Cholecystectomy for Uncomplicated Biliary Colic
(Cochrane DB Syst Rev 2013;6:CD007196)
Study: To assess the benefits and harms of early vs. delayed laparoscopic cholecystectomy for patients with uncomplicated biliary colic due to gallstones.
Results: One trial with 75 participants, average age 43 yr. Early laparoscopic cholecystectomy (<24 h) vs. delayed (mean wait period 4.6 mo). The proportion of serious adverse events was lower in the early vs. delayed group (0% vs. 22.5%, respectively). There was a shorter hospital stay in the early group (MD -1.25 d, 95% CI -2.05 to -0.45) and a shorter operating time in the early group (MD -14.80 min, 95% CI -18.02 to -11.58). There was no difference in the proportion of patients requiring conversion to open cholecystectomy in the two groups.
Conclusion: Early laparoscopic cholecystectomy (<24 h of diagnosis of biliary colic) decreased morbidity during the waiting period for elective laparoscopic cholecystectomy, hospital stay, and operating time.
Investigations
- blood work: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT, and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative

Complications
- Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct
- empyema of gallbladder: suppurative cholecystitis, pus in gallbladder + sick patient
- emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall, or pericholecystic space (risk in diabetic patient); organisms involved in secondary infection: E. coli, Klebsiella, Enterococcus
- gangrenous gallbladder (20%), perforation (2%): result in abscess formation or peritonitis
- cholecystoenteric fistula, from repeated attacks of cholecystitis, can lead to gallstone ileus

Treatment
- admit, hydrate, NPO, NGT (if persistent vomiting from associated ileus), analgesics once diagnosis is made
- antibiotics
  - cefazolin if uncomplicated cholecystitis
- ERCP prior to surgery if US if CBD stones are present
  - MRCP ± ERCP if CBD is markedly dilated or CBD stones suspected
- cholecystectomy
  - early (within 72 h) vs. delayed (after 6 wk)
    - equal morbidity and mortality
    - early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
    - emergent OR indicated if high risk, e.g. emphysematous
  - laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-operative pain, increased risk of bile duct injury
  - intra-operative cholangiography (IOC)
    - indications: clarify bile duct anatomy, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct (>15 mm), jaundice
  - percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

Acalculous Cholecystitis

Definition
- acute or chronic cholecystitis in the absence of stones

Pathogenesis
- typically due to gallbladder ischemia, stasis

Risk Factors
- DM, immunosuppression, ICU admission, trauma patient, TPN, sepsis

Clinical Features
- see Acute Cholecystitis, GS47
- occurs in 20% of cases of acute cholecystitis

Investigations
- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see Acute Cholecystitis)
- CT or HIDA scan

Treatment
- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy

Choledocholithiasis

Definition
- stones in CBD

Clinical Features
- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, fluctuating jaundice
- primary vs. secondary stones
  - primary: formed in bile duct, indicates bile duct pathology (e.g. benign biliary stricture, sclerosing cholangitis, choledochal cyst, CF)
  - secondary: formed in gallbladder (85% of cases in U.S.)
Investigations
• CBC: usually normal; leukocytosis suggests cholangitis
• LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), ALP, GGT later
• amylase/lipase: to rule out gallstone pancreatitis
• U/S: intra-/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
• MRCP (90% sensitive)

Complications
• cholangitis, pancreatitis, biliary stricture, and biliary cirrhosis

Treatment
• treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

Acute Cholangitis

Pathogenesis
• obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration and biliary sepsis – may be life-threatening, especially in elderly

Etiology
• choledocholithiasis (60%), stricture, neoplasm (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), biliary stent
• organisms: E. coli, Klebsiella, Pseudomonas, Enterococcus, B. fragilis, Proteus

Clinical Features
• Charcot's triad: fever, RUQ pain, jaundice
• Reynold's pentad: fever, RUQ pain, jaundice, shock, confusion
• may have N/V, abdominal distention, ileus, acholic stools, tea-coloured urine (elevated direct bilirubin)

Investigations
• CBC; elevated WBC + left shift
• may have positive blood cultures
• LFTs: obstructive picture (elevated ALP, GGT, and conjugated bilirubin, mild increase in AST, ALT)
• amylase/lipase: rule out pancreatitis
• U/S: intra-/extra-hepatic duct dilatation

Treatment
• initial: NPO, fluid and electrolyte resuscitation, ± NGT, IV antibiotics (treats 80%)
• biliary decompression
  • ERCP + sphincterotomy: diagnostic and therapeutic
  • PTC with catheter drainage: if ERCP not available or unsuccessful
  • laparotomy with CBD exploration and T-tube placement if above fails
• all patients should also have a cholecystectomy, unless contraindicated

Prognosis
• suppurative cholangitis mortality rate: 50%

Gallstone Ileus

Pathogenesis
• repeated inflammation causing a cholecystoenteric fistula (usually duodenal) → large gallstone enters the gut and impacts near the ileocecal valve, causing a true bowel obstruction (note: ileus is a misnomer in this context)

Clinical Features
• crampy abdominal pain, N/V (see Large Bowel Obstruction, GS29)

Investigations
• AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, air in biliary tree (pneumobilia) (40%)
• CT: biliary tract air, obstruction, gallstone in intestine
• Rigler's triad: pneumobilia (air in biliary tree), small bowel obstruction (partial or complete), gallstone (usually in right iliac fossa)

Treatment
• fluid resuscitation, NGT decompression
• surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
• may close fistula surgically or manage expectantly (can resolve spontaneously)
• cholecystectomy is generally not performed
Carcinoma of the Gallbladder

Risk Factors
- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (*Salmonella, Helicobacter*), abnormal pancreaticobiliary duct junction

Clinical Features
- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of open cholecystectomies 0.1% in laparoscopic cholecystectomies)
- many patients are asymptomatic until late
- local: non-specific RUQ pain, ± palpable RUQ mass
- Courvoisier’s gallbladder: an enlarged, often palpable gallbladder in a patient with carcinoma of the head of the pancreas; associated with jaundice due to obstruction of the CBD
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

Investigations
- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, good for staging, allows sampling of bile for cytology
- abdominal CT: polyloid mass, mural thickening, liver invasion, nodal involvement, distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

Treatment
- if carcinoma of the gallbladder is suspected pre-operatively, an open cholecystectomy should be considered to avoid tumour seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy, en bloc wedge resection of 3-5 cm underlying liver, dissection of hepatoduodenal lymph nodes

Prognosis
- poor 5 yr survival (10%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

Cholangiocarcinoma

Definition
- malignancy of extra- or infrahepatic bile ducts

Risk Factors
- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, *Clonorchis sinensis* infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

Clinical Features
- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, pale stools
- anorexia, weight loss, RUQ pain, Courvoisier’s sign (if CBD obstructed), hepatomegaly
- early metastases are uncommon, but commonly tumour grows into portal vein or hepatic artery
- Klatskin tumour: cholangiocarcinoma located at bifurcation of common hepatic duct

Investigations
- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

Treatment
- if resectable biliary drainage and wide excision margin
- intra-hepatic lesions: liver resection
  - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
  - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
  - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)
- chemotherapy ± radiotherapy
- role for transplantation in selected patients with Klatskins tumours

Prognosis
- overall 5 yr survival: 15%

### Ranson’s Criteria

**A. At admission**
1. Age > 55 yr
2. WBC > 16 x 10^9/L
3. Glucose > 11 mmol/L
4. LDH > 350 IU/L
5. AST > 250 IU/L

**B. During initial 48 h**
1. Hct drop > 10%
2. BUN rise > 1.8 mmol/L
3. Arterial PO2 < 60 mmHg
4. Base deficit > -4 mmol/L
5. Calcium < 2 mmol/L
6. Fluid sequestration > 6 L

**C. Interpretation**
- 2 = difficult course
- 3 = high mortality (≥15%)

---

**Courvoisier’s Sign**
Palpable, nontender distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger.
Pancreas

Acute Pancreatitis

- see Gastroenterology, G44

GALLSTONE PANCREATITIS (35% of Acute Pancreatitis)

Pathogenesis
- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

Clinical Features (Pancreatitis of Any Etiology)
- pain (epigastric pain radiating to back), N/V, ileus, peritoneal signs, jaundice, fever
- Inglefinger’s sign: pain worse when supine, better when sitting forward
- may have coexistent cholangitis or pancreatic necrosis
- Ranson’s criteria for determining prognosis of acute pancreatitis (see sidebar)
- physical exam may show: tachypnea, tachycardia, hypotension, abdominal distention and tenderness, Cullen’s sign, Grey Turner’s sign

Investigations
- elevated amylase (higher than alcoholic pancreatitis), lipase, leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), edematous pancreas
- CXR, AXR, CT (if severe to evaluate for complications)

Treatment
- supportive: e.g. NPO, hydration, analgesia, early enteric nutrition
- antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if CBD stone impacted or cholangitis
- surgical indications in acute pancreatitis (rare):
  - drain placement and debridement for necrotizing pancreatitis if refractory to medical management, if septic or in ICU without other sources of sepsis

Complications
- acute fluid collections
- pseudocyst (collection of pancreatic secretions >4 wk old surrounded by a defined wall of granulation tissue)
- abscess/infection, necrosis
- splenic/mesenteric/portal vessel thrombosis
- pancreatic ascites/pancreatic pleural effusion
- DM
- ARDS/sepsis/multiorgan failure
- coagulopathy/DIC
- severe hypocalcemia

Chronic Pancreatitis

- see Gastroenterology, G45

Surgical Treatment
- treatment is generally medical
- indications for surgery
  - failure of medical treatment
  - debilitating abdominal pain
  - pseudocyst complications: persistence, hemorrhage, infection, rupture
  - CBD obstruction (e.g. strictures), duodenal obstruction
  - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
  - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
  - anatomical abnormality causing recurrent pancreatitis
- pre-operative CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options
  - endoscopic pancreatic duct decompression: less effective than surgery
  - extracorporeal shockwave lithotripsy: if pancreatic duct stones
  - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery
surgical options
- drainage procedures: only effective if ductal system is dilated
  - Puestow procedure (lateral pancreaticojejunostomy): improves pain in 80% of patients
- pancreatoduodenectomy: best option in absence of dilated duct
  - proximal disease: Whipple procedure (pancreaticoduodenectomy) – pain relief in 80%
  - distal disease: distal pancreatoduodenectomy ± Roux-en-Y pancreaticojejunostomy
- total pancreatoduodenectomy: refractory disease
- denervation of celiac ganglion and splanchnic nerves

PSEUDOCYST
- localized fluid collections rich in pancreatic enzymes, with a non-epithelialized wall consisting of fibrous and granulation tissue
- complication of chronic and/or acute pancreatitis
- often resolve spontaneously
- cyst wall must be mature prior to drainage (4-6 wk)
- pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first

Treatment
- expectant management if asymptomatic
- endoscopic drainage
  - cystgastrostomy
  - cystduodenostomy
- percutaneous catheter drainage
- surgical drainage (gold standard)
  - cystgastrostomy
  - cystenterostomy
- resection
  - consider biopsy of cyst wall to rule out cystadenocarcinoma

Pancreatic Cancer

Epidemiology
- fourth most common cause of cancer-related mortality in both men and women in Canada
- M:F = 1.3:1, average age: 50-70

Risk Factors
- increased age
- smoking: 2-5x increased risk, most clearly established risk factor
- high fat/low fibre diets, heavy alcohol use
- obesity
- DM, chronic pancreatitis
- partial gastrectomy, cholecystectomy
- chemicals: betanaphthylamine, benzidine
- African descent

Clinical Features
- head of the pancreas (70%)  
  - weight loss, obstructive jaundice, steatorrhea, vague constant mid-epigastric pain (often worse at night, may radiate to back)
  - painless jaundice, Courvoisier’s sign
- body or tail of pancreas (30%)
  - tends to present later and usually inoperable
  - weight loss, vague mid-epigastric pain
  - <10% jaundiced
  - sudden onset DM

Investigations
- serum chemistry is non-specific, can have elevated ALP and high bilirubin
- CA 19-9 (most useful serum marker of pancreatic cancer)
- U/S, CT (also evaluates metastasis and resectability) ± ERCP, MRI, EUS

Pathology
- ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- intraductal papillary mucinous neoplasm (IPMN)
- other: pancreatic neuroendocrine tumours (non-functional, insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma), mucinous cystic neoplasm (MCN), acinar cell carcinoma
  - see Surgical Endocrinology, GS60 for functional pancreatic neuroendocrine tumours
Treatment
• resectable (10-20% of pancreatic cancer)
  ■ no involvement of liver, peritoneum, or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
  ■ Whipple procedure (pancreaticoduodenectomy) for cure <5% mortality
  ■ distal pancreatectomy ± splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas
  ■ locally advanced, borderline resectable
  ■ tumours that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
  ■ locally advanced, non-resectable (palliative -→ relieve pain, obstruction)
  ■ encasement of major vascular structures including artery
  ■ most body/tail tumours are not resectable (due to late presentation)
  ■ relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure
    (choledochoenterostomy + gastroenterostomy)
  ■ palliative chemotherapy (gemcitabine + nab-paclitaxel, FOLIRINOX) ± radiotherapy

Prognosis
• most important prognostic indicators are lymph node status, margin status, size >3 cm, perineural invasion (invasion of tumour into microscopic nerves of pancreas)
• overall 5 yr survival for all patients with pancreas cancer is 1%; following surgical resection 5 yr survival is 20%
• median survival for unresectable disease: 3-6 mo if metastatic, 8-12 mo if locally advanced at presentation

Steps of a Whipple Resection (Pancreatoduodenectomy)
1. Assessment of metastatic disease (all peritoneal surfaces)
2. Mobilization of the duodenum and head of the pancreas
3. Identification of the superior mesenteric vein and mobilization of the pancreatic neck
4. Mobilization of the stomach; dissection of the hepatoduodenal ligament and choledochojejunostomy
5. Division of the stomach, proximal jejunum, and CBD
6. Transection of the pancreatic neck and dissection of the unciate process from the retroperitoneum
7. Restoration of gastrointestinal continuity: construction of a pancreaticojejunostomy, hepaticojejunostomy, gastrojejunostomy using a neoduodenum

Removed
• CBD
• Gallbladder
• Duodenum
• Pancreatic head
• Distal stomach (sometimes)

Diagnostic Value of Serum Carbohydrate Antigen 19-9 in Pancreatic Cancer: A Meta-Analysis

Summary: 11 studies with 2,316 patients were included in the analysis. The sensitivity of CA19-9 in the diagnosis of pancreatic cancer was found to be 0.9 (95% CI 0.77-0.92) and the specificity also 80% (95% CI 0.77-0.82) with a diagnostic odds ratio of 14.79 (95% CI 8.55-25.59). Overall, CA19-9 plays an important role in the diagnosis of pancreatic cancer.

Figure 26. Schematic of Whipple resection, showing the resected components
Spleen

Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr's sign

Treatment

- non-operative
  - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
  - hemostatic control
  - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemoperitoneum
- operative
  - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
  - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
  - total splenectomy if patient unstable or high-grade injury

Splenectomy

Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenic purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenic purpura (TTP), sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIg

Complications

- short-term
  - injury to surrounding structures (e.g. gastric wall, tail of pancreas)
  - post-operative thrombocytosis, leukocytosis
  - thrombosis of portal, splenic, or mesenteric veins
  - subphrenic abscess
- long-term
  - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr old)
    - 50% mortality
    - prophylaxis with vaccinations, ideally 2 wk pre- or post-operative (pneumococcal, *H. influenzae*, and meningococcus)
    - liberal use of penicillin especially in children <6 yr old
  - splenosis: intra-abdominal "seeding" of splenic tissue during removal
Benign Breast Lesions

Three Categories
1. nonproliferative
2. proliferative without atypia
3. atypical hyperplasia

NONPROLIFERATIVE LESIONS
- benign breast condition characterized by fibrous and cystic changes in the breast
- most common: breast cysts
- other lesions include papillary apocrine change, epithelial-related calcifications and mild hyperplasia of the usual type
- no increased risk of breast cancer
- age 30 to menopause (and after if HRT used)
- clinical features
  - breast pain, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, nipple discharge (straw-like, brown, or green)
- treatment
  - evaluation of breast mass (U/S, mammography as indicated) and reassurance
  - no strong evidence for avoidance of xanthine-containing products (coffee, tea, chocolate, cola)
  - analgesia (ibuprofen, ASA)
  - no atypia or DCIS

PROLIFERATIVE LESIONS – WITHOUT ATYPIA

<table>
<thead>
<tr>
<th>Clinical Features</th>
<th>Diagnosis</th>
<th>Treatment</th>
<th>Risk of Breast Cancer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fibroadenoma</td>
<td>Most common breast tumour in women &lt;30 yr</td>
<td>Nodules: firm, rubbery, discrete, well-circumscribed, non-tender, mobile, hormone-dependent (unlike cysts), needle aspiration yields no fluid</td>
<td>Core or excisional biopsy sometimes required if concerned about malignancy US and FNA alone cannot differentiate fibroadenoma from Phyllodes tumour</td>
</tr>
<tr>
<td>Intraductal Papilloma</td>
<td>Solitary intraductal benign polyp</td>
<td>Can present as nipple discharge (most common cause of spontaneous, unilateral, bloody nipple discharge = pathologic nipple discharge), breast mass, nodule on US</td>
<td>Surgical excision of involved duct to ensure no atypia</td>
</tr>
<tr>
<td>Usual Ductal Hyperplasia</td>
<td>Increased number of cells within the ductal space</td>
<td>Incidental finding on biopsy of mammographic abnormalities or breast masses</td>
<td>None required</td>
</tr>
<tr>
<td>Sclerosing Adenosis</td>
<td>Lobular lesion with increased fibrous tissue and glandular cells</td>
<td>Mass or mammographic abnormality</td>
<td>None required</td>
</tr>
</tbody>
</table>
ATYPICAL HYPERPLASIA
- can involve ducts (ductal hyperplasia with atypia) or lobules (lobular hyperplasia with atypia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

OTHER LESIONS

Fat Necrosis
- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction, ± tenderness
- regress spontaneously, but complete imaging ± biopsy to rule out carcinoma

Mammary Duct Ectasia
- obstruction of a subareolar duct leading to duct dilation, inflammation, and fibrosis
- may present with nipple discharge, bluish mass under nipple, local pain
- risk of secondary infection (abscess, mastitis)
- resolves spontaneously

Montgomery Tubercle
- Montgomery tubercles (or Morgagni tubercles) are papular projections at the edge of the areola
- obstruction of these glands can lead to inflammation or cystic collections (cyst of Montgomery i.e. retroareolar cyst)
- if signs of secondary infection, start treatment for mastitis
- resolves spontaneously in weeks to years

Abscess
- lactational (see Obstetrics, OB45) vs. periductal/subareolar
- unilateral localized pain, tenderness, erythema, subareolar mass, nipple discharge, nipple inversion
- rule out inflammatory carcinoma, as indicated
- treatment: initially broad-spectrum antibiotics and I&D, if persistent total duct excision (definitive)
- if mass does not resolve: U/S to assess for presence of abscess, core biopsy to exclude cancer, consider MRI

Breast Cancer

Epidemiology
- leading cancer diagnosis in women in NA, 2nd leading cause of cancer mortality in women
- 1 in 8 (12.9% life time risk) women in Canada will be diagnosed with breast cancer in their lifetime
- 1 in 30 women in Canada will die from breast cancer
- all age relative survival is 88%

Risk Factors
- gender (99% female)
- age (80% >40 yr old)
- personal history of breast cancer and/or prior breast biopsy (regardless of pathology)
- family history of breast cancer (greater risk if relative was first degree and premenopausal)
- high breast density, nulliparity, first pregnancy >30 yr, menarche <12 yr, menopause >55 yr
- decreased risk with lactation, early menopause, early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT use, >10 yr OCP use
- BRCA1 and BRCA2 gene mutations
- alcohol use, obesity, sedentary lifestyle

Male breast cancer (<1%)
- most commonly invasive ductal carcinoma
- often diagnosed at later stages
- stage-for-stage similar prognosis to breast cancer in females
- consider genetic testing: most often hormone receptor positive

Investigations
- mammography
  - indications
    - screening guidelines (see Family Medicine, FM4)
    - findings indicative of higher risk of malignancy
      - mass that is poorly defined, spiculated border
      - microcalcifications
      - architectural distortion
      - interval mammographic changes
    - normal mammogram does not rule out suspicion of cancer based on clinical findings
• other radiographic studies
  ■ U/S: differentiate between cystic and solid
  ■ MRI: high sensitivity, low specificity
  ■ galactogram/ductogram: for nipple discharge; identifies lesions in ducts
  ■ metastatic workup indicated in Stage II-IV disease: bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), CT head (if specific neurological symptoms)

Diagnostic Procedures
• needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
• U/S or mammography guided core needle biopsy (most common)
• FNA: for palpable solid masses; need experienced practitioner for adequate sampling
• excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

Genetic Screening
• consider testing for BRCA1/2 if
  ■ patient diagnosed with breast AND ovarian cancer
  ■ strong family history of breast/ovarian cancer
  ■ family history of male breast cancer
  ■ young patient (<35 yr)
  ■ bilateral breast cancer in patients <50 yr

Staging
• patients are assigned a clinical stage pre-operatively (cTNM); following surgery the pathologic stage is determined (pTNM)

  • clinical
  ■ tumour size by palpation, mammogram, U/S and/or MRI
  ■ nodal involvement by palpation, imaging
  ■ metastasis by physical exam, CXR, and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-operative if node-positive disease)

  • pathological
  ■ tumour size and type (see Pathology)
  ■ grade: modified Bloom and Richardson score (I to III) – histologic, nuclear, and mitotic grade
  ■ number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, sentinel lymph node biopsy (SLNB) positive/negative
  ■ tumour biology: estrogen receptor (ER), progesterone receptor (PR) and HER2/neu oncogene status
  ■ margins: for invasive breast cancer negative margin is sufficient, for DCIS prefer 2mm margin
  ■ lymphovascular invasion (LVI)
  ■ extensive in situ component (EIC): DCIS in surrounding tissue
  ■ involvement of dermal lymphatics (inflammatory) – automatically Stage IIIb

Pathology

NON-INVASIVE

Ductal Carcinoma in situ (DCIS)
• proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
• 80% non-palpable, detected by screening mammogram
• risk of invasive ductal carcinoma in same breast up to 35% in 10 yr
• treatment
  ■ lumpectomy with wide excision margins + radiation (5-10% risk of invasive cancer)
  ■ mastectomy if large area of disease, high grade, or multifocal (risk of invasive cancer reduced to 1%)
  ■ possibly tamoxifen as an adjuvant treatment
  ■ 99% 5 yr survival

Lobular Carcinoma in situ (LCIS)
  ■ neoplastic cells completely contained within breast lobule
  ■ no palpable mass, no mammographic findings, usually incidental finding on breast biopsy for another indication
  ■ LCIS is a risk factor for invasive carcinoma (approximately 1%/yr)
  ■ treatment
    • if diagnosed on core biopsy, excisional biopsy necessary to rule out malignancy
    • if diagnosed on excisional biopsy, wide excision not needed since LCIS if often multicentric and not managed as precursor lesion
    • clinical follow-up and surveillance
    • consider chemoprevention (e.g. tamoxifen)

INVASIVE

Invasive Ductal Carcinoma (most common 80%)
  ■ originates from ductal epithelium and infiltrates supporting stroma
  ■ characteristics: hard, scirrhous, infiltrating tentacles, gritty on cross-section

Invasive Lobular Carcinoma (8-15%)
  ■ originates from lobular epithelium
  ■ 20% bilateral (i.e. more often than infiltrating ductal carcinoma)
  ■ does not form microcalcifications, harder to detect mammographically (may benefit from MRI)

Paget’s Disease (1-3%)
  ■ ductal carcinoma that invades nipple with scaling, eczematoid lesion

Inflammatory Carcinoma (1-4%)
  ■ ductal carcinoma that invades dermal lymphatics
  ■ most aggressive form of breast cancer
  ■ clinical features: erythema, skin edema, warm, swollen, and tender breast ± lump
  ■ peau d’orange indicates advanced disease (IIIb-IV)

Sarcomas: rare
  ■ most commonly Phyllodes tumour, a variant of fibroadenoma with potential for malignancy
  ■ can also be angiosarcomas – after previous radiation

Lymphoma: rare

Other
  ■ papillary, medullary, mucinous, tubular cancers
  ■ generally better prognosis

Treatment

Table 24. Breast Cancer Treatment by Stage

<table>
<thead>
<tr>

</tr>
<tr>
<td>III</td>
<td>Likely mastectomy + axillary node dissection + radiotherapy after chemotherapy (neoadjuvant)</td>
<td>Neoadjuvant therapy should be considered i.e. pre-operative especially if not resectable chemotherapy and/or hormone therapy. Adjuvant radiation and chemotherapy may also be appropriate (i.e. post-operative)</td>
</tr>
<tr>
<td>Inflammatory</td>
<td>Mastectomy + axillary node dissection + radiotherapy</td>
<td>Neoadjuvant therapy</td>
</tr>
<tr>
<td>IV</td>
<td>Surgery as appropriate for local control</td>
<td>Primary treatment is systemic therapy i.e. chemotherapy and/or hormone therapy</td>
</tr>
</tbody>
</table>

BCS = breast conserving surgery; SLNB = sentinel lymph node biopsy

*If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient’s preference since choice of local treatment does not significantly affect survival if local control is achieved.
PRIMARY SURGICAL TREATMENT

Breast Conservation Surgery (BCS)
- lumpectomy must be combined with radiation for survival equivalent to mastectomy
- contraindications include
  - high risk of local recurrence e.g. extensive malignant-type calcifications on mammogram, multifocal primary tumours
  - failure to obtain tumour-free margins after re-excision
  - not suitable for radiation therapy (pregnancy, previous radiation, collagen vascular disease)
  - large tumour size relative to breast

Mastectomy
- radical mastectomy (rarely): removes all breast tissue, skin, pectoralis muscle, axillary nodes
- modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
- simple mastectomy: removes all breast tissue and skin
- see Plastic Surgery, PL34 for breast reconstruction

Sentinel Lymph Node Biopsy (SLNB)
- perform in women with clinically node-negative invasive breast cancer and those with extensive DCIS who are undergoing mastectomy
- patients with clinically suspicious nodes should U/S + FNA prior to decision to proceed with SLNB
- technetium-99 ± blue dye injected at tumour site prior to surgery to identify sentinel node(s)
- intra-operative frozen section evaluated can be considered
- proceed with ALND if >3 positive nodes, with 1-3 nodes whole breast radiation therapy may be alternative
- 5% false negative rate

Axillary Lymph Node Dissection (ALND)
- perform in all patients with pathologic confirmation of nodal involvement (including positive SLNB as above)
- risk of arm lymphedema (10-15%) especially if getting radiation therapy, decreased arm sensation, shoulder pain

ADJUVANT/NEOADJUVANT

Radiation
- indications
  - decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy
  - inoperable locally advanced cancer
  - axillary nodal radiation may be added if nodal involvement

Hormonal
- indications
  - ER positive plus node-positive or high-risk node-negative
  - SERM if premenopausal (e.g. tamoxifen) or aromatase inhibitors if postmenopausal (e.g. anastrozole); optimal duration 5-10 yr
  - ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), androgens (e.g. fluoxymesterone) are other options
  - palliation for metastatic disease

Chemotherapy
- indications
  - ER negative plus node-positive or high-risk node-negative
  - ER positive and young age
  - stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
  - palliation for metastatic disease
  - can consider oncoype DX (21 gene analysis) to provide recurrence score (low, intermediate, high)

FOLLOW-UP

Post-Treatment Follow-Up
- assessment and physical exam q3-6mo x 3 yr, q6-12mo x 2yr, and annually thereafter
- following BCS mammography q6-12mo; can reduce to annual once stable, no other routine imaging unless clinically indicated
- women who receive tamoxifen should have regular gynecologic follow-up (increased risk of endometrial cancer)
- psychosocial support and counselling
- delayed breast reconstruction if underwent a mastectomy
Local/Regional Recurrence
• recurrence in treated breast or ipsilateral axilla
• 1% per yr up to maximum of 15% risk of developing contralateral malignancy
• 5x increased risk of developing metastases

Metastasis
• bone > lungs > pleura > liver > brain
• treatment is palliative: hormone therapy, chemotherapy, radiation
• overall survival of metastatic breast cancer is 36-60 mo

Thyroid and Parathyroid

Thyroidectomy
• indications: thyroid cancer, symptomatic thyroid mass or goitre, medically refractory Graves’ or hyperthyroidism
• contraindications: uncontrolled severe hyperthyroidism (i.e. Graves’) due to risk of intra-operative or post-operative thyroid storm
• pre-operative workup: thyroid U/S for thyroid nodules, FNA for large nodules, U/S of the neck for lesions suspicious for papillary or medullary thyroid cancer, CT neck useful to rule out extension, vocal cord function
• complications: hypocalcemia secondary to hypoparathyroidism, recurrent/superior laryngeal nerve injury, neck hematoma, infection, thyrotoxic storm

Parathyroidectomy
• indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum Ca, marked hypercalcuria, Cr clearance <30% normal, bone density reduction with T score <2.5, <50 yr)
• contraindications: familial hypocalciuric hypercalcemia
• pre-operative workup: 99mTc sestamibi scanning, ± SPECT or CT, U/S
• complications: recurrent/superior laryngeal nerve injury, post-operative hypocalcemia, infection, bleeding

Adrenal Gland

see Endocrinology, E29

functional anatomy
• cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), reticularis (sex steroids)
• medulla: catecholamines (epinephrine, norepinephrine)
• types of adrenal tumours: functional (e.g. Cushing's syndrome, Conn's syndrome) or non-functional

INCIDENTALOMA
• adrenal mass discovered by investigation of unrelated symptoms

Epidemiology
• benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
• metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, kidney
• peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

Investigations
• MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
• functional studies
  • pheochromocytoma: 24 h urine epinephrine, norepinephrine, metanephrine, normetanephrine, VMA (vanillylmandelic acid)
  • Cushing’s: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
  • aldosteronoma: electrolytes, aldosterone-renin level, saline suppression test if appropriate
  • adrenal androgens: 17-OH progesterone, DHEAS
• FNA biopsy: if suspect metastasis to adrenal (must exclude pheochromocytoma first to prevent a hypertensive crisis)
  • indicated if history of cancer or patient is smoker
• iodocholesterol scintigraphy: may distinguish benign vs. malignant disease
Treatment
• functional tumour: resect
• non-functional tumour
  ■ >4 cm: resect
  ■ <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

Pancreas

INSULINOMA
• tumour that secretes insulin
• most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

Clinical Features
• Whipple's triad
  palpitations, trembling, diaphoresis, confusion, seizure, personality changes

Investigations
• blood work: decreased serum glucose and increased serum insulin and C-peptide
• U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

Treatment
• only 10% are malignant
• enucleation of solitary insulinomas may be done endoscopically
• tumours >2 cm located close to the pancreatic duct may require pancreatectomy or
pancreaticoduodenectomy

GASTRINOMA
• tumour secreting gastrin; cause of Zollinger-Ellison syndrome

Clinical Features
• abdominal pain, PUD, severe esophagitis
• multiple ulcers in atypical locations refractory of antacid therapy

Investigations
• blood work: serum gastrin levels (usually >1,000 pg/mL), secretin stimulation test
• U/S, CT: 70-90% found in Passaro's triangle (head of pancreas medially, 2nd portion of duodenum
  inferiorly, and the confluence of the cystic and CBD superiorly)
• octreotide scintigraphy scan

Treatment
• 50% are malignant
• surgical resection of tumour dependent on location
• non-surgical treatment: chemotherapy, somatostatin analogues, interferon, chemoembolization
• if inoperable, vagotomy can be performed for symptomatic control

VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOUR
• tumour secreting VIP; commonly located in the distal pancreas and most are malignant when
diagnosed

Clinical Features
• severe watery diarrhea causing dehydration, weakness, electrolyte imbalance

Investigations
• blood work: serum VIP levels
• U/S, CT

Treatment
• somatostatin analogues
• surgical resection/palliative debulking

Whipple’s Triad
• Symptomatic fasting hypoglycemia
• Serum glucose <50 mg/dL
• Relief of symptoms when glucose is administered

Rule of 2s for Meckel’s Diverticulum
• 2% of the population
• 2:1 male-to-female ratio
• Symptomatic in 2% of cases
• Found within 2 feet (10-90 cm) of the ileocecal (IC) valve
• 2 inches in length
• 2 inches in diameter
• 2 types of tissue (gastric, pancreatic)
• Often present by 2 yr of age
### Pediatric Surgery

<td>----------</td>
<td>----------</td>
</tr>
<tr>
<td>Hirschsprung’s Disease</td>
<td>1:5,000 births M:F = 3:1 to 4:1, approaches 1:1 when whole colon involved Can have aganglionosis of small bowel as well Familial Hirschsprung’s in &lt;5% of cases</td>
<td>Defect in migration of neurocryst cells to intestine resulting in aganglionic bowel that fails to peristalsis and internal sphincter that fails to relax (internal anal sphincter achalasia) causing functional and partial mechanical obstruction, respectively always starts in the rectum and variable involvement proximally; RET mutation</td>
<td>Failure to pass meconium spontaneously within 6h of life is the classic history (95% pass meconium within 24h, 5% within 48h) Symptoms of bowel obstruction: constipation, bilious emesis Enterocolitis/vomiting Failure to thrive</td>
<td>Rectal biopsy (gold standard) – look for aganglionosis and neural hypothyrosis AUR Contrast enema to find narrow rectum and transition zone Anal manometry unreliable in infants – classic finding is absence of rectoanal inhibitory reflex</td>
<td>Surgical resection of aganglionic intestinal segment and anastomosis of remaining intestine to anus Either in newborn period or staged if extensive aganglionosis</td>
<td>Most have normal near-normal anorectal function Complications: Fecal incontinence and constipation, post-operative enterocolitis (medical emergency if progresses to sepsis)</td>
<td></td>
</tr>
<tr>
<td>Cryptorchidism</td>
<td>2-3% of term males – most of these descend spontaneously by time of age 1% of males do not spontaneously descend</td>
<td>Idiopathic Descent is mediated by descendin which is created in response to testosterone. Descent usually begins at 28 weeks</td>
<td>Palpable testicle within inguinal canal or testicle which can be milked down into scrotum (called retrograde testicle) Occasionally no-palpable testis as it is intra-abdominal Consider other congenital abnormalities</td>
<td>Bi-annual testicular exam with palpation Distinguish truly undescended testes from retrograde testes (which is “high” testis due to hyperactive cremasteric muscles)</td>
<td>Depends on age of presentation USS or MRI if no palpable testes Older child: LH, FSH, MS, HCG stimulation test for gonadotropin production Infant: USS, FSH, LH, karyotyping, 17-hydroxy-progesterone</td>
<td>HCG to stimulate testosterone production and descent Orchidopexy – especially if undescended by age 6 mo-2 yr Orchidopexy Decreased risk of torsion and blunt trauma to testicle No effect on malignant potential of testicle Descent can preserve spermatogenesis if performed by 1 yr of age</td>
<td></td>
</tr>
<tr>
<td>Intussusception</td>
<td>Most common cause of bowel obstruction between 6-36 mo 26:100,000 newborns M:F = 1.2 Pathologic lead points: enlarged Peyer’s patches due to viral infections of the Gl tract, polyps, Meckel’s diverticulum CF lymphoma, IBD may increase risk</td>
<td>Idiopathic is most common Usually starts at ileocecal junction Telescopy of bowel into itself causing an obstruction and vascular compromise</td>
<td>Acute onset of abdominal pain which is classic episodic “cyclic” pain Vomiting: ± bilious Abdominal mass Current-jelly stool suggests mucosal necrosis and sloughing</td>
<td>Abdominal exam Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness Signs of bowel obstruction: distended abdomen Look for localized peritonitis which suggests transmural ischemia</td>
<td>AUR for signs of bowel obstruction or perforation USS if suspect pathology</td>
<td>If perforation, then consider operative management Non-operative management involves reduction via air contrast enema Operative reduction can be done open or laparoscopically Resection of involved colon if failure to reduce or bowel appears compromised</td>
<td>10% recurrence rate If recurrent = more likely non-dispatiche If successfully reduced by enema in older children allow 2wk resolution of edema then perform SBFT to rule out pathologic lead points</td>
</tr>
<tr>
<td>Tracheoesophageal Fistula (TEF)</td>
<td>1:3,000-1:4,500 Associated anomalies in 50% VACTERL association (see Pediatrics, P40)</td>
<td>Varies with type of fistula May have history of maternal polyhydramnios May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning</td>
<td>X-ray: anatomic abnormalities, NGT curled in pouch</td>
<td>Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth</td>
<td>Complications: pneumonia, sepsis, reactive airways disease Following repair: esophageal stenosis and strictures at repair site, GERD and poor swallowing (i.e. dysphagia, regurgitation)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Inguinal Hernias</td>
<td>5% of all term newborns 2x risk and more likely bilateral if pre-term M:F = 4:1 Low birth weight increases risk 1/5 inguinal hernias will become incarcerated if patient is &lt;1 yr old Incarceration is more common in females Associated with other conditions: androgen insensitivity, connective tissue diseases</td>
<td>All infant hernias are indirect: descent of intra-abdominal contents through the internal inguinal ring through a patent tunica vaginalis</td>
<td>Most common presentation: painless intermittent mass in groin, may also note extension into scrotum (scrotal mass in absence of inguinal mass is a hydrocele) If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted</td>
<td>Palpate for “bag of worms” suggests possible testicular varicocele Biannual testicular exam + palpation along inguinal canal to evaluate for any masses “Silk sign” – palpable thickening of cord Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen Must always try reduction to confirm that hernia is not incarcerated</td>
<td>Physical exam is gold standard U/S only if physical exam uncertain (e.g. in small infants where exam can be difficult)</td>
<td>Manual reduction – to relieve acute symptoms Herniomy – definitive treatment by reduction of herniated contents and high ligation of sac for indirect hernias Laparoscopic or open techniques</td>
<td>Risk of recurrence after surgical reduction &lt;3% but higher if repair done in premature infants or if hernia was incarcerated/strangled at repair</td>
</tr>
</tbody>
</table>

**Notes:**
- **Cryptorchidism**
  - Most common cause of bowel obstruction between 6-36 mo
  - 26:100,000 newborns
  - M:F = 1.2
  - Pathologic lead points: enlarged Peyer’s patches due to viral infections of the Gl tract, polyps, Meckel’s diverticulum, CF, lymphoma, IBD may increase risk

- **Intussusception**
  - Most common cause of bowel obstruction
  - Usually starts at ileocecal junction
  - Telescopy of bowel into itself causing an obstruction and vascular compromise

- **Tracheoesophageal Fistula (TEF)**
  - Associated anomalies in 50% VACTERL association
  - Varies with type of fistula
  - May have history of maternal polyhydramnios
  - May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning

- **Inguinal Hernias**
  - 5% of all term newborns
  - 2x risk and more likely bilateral if pre-term
  - M:F = 4:1
  - Low birth weight increases risk
  - 1/5 inguinal hernias will become incarcerated if patient is <1 yr old
  - Incarceration is more common in females
  - Associated with other conditions: androgen insensitivity, connective tissue diseases
Skin Lesions

- see Dermatology, D5; Emergency Medicine, ER17; Plastic Surgery, PL5

### Common Medications

#### Antiemetics
- dimenhydrinate (Gravol®) 25-50 mg PO/IM q4-8h
- prochlorperazine (Stemetil®) 5-10 mg PO/IM bid-tid
- metoclopramide (Maxeran®) 10 mg IV/IM q2-3h
- ondansetron (Zofran®) 4-8 mg PO q6h
- granisetron (Kytril®) 1 mg PO bid (for nausea from chemotherapy/radiation)

#### Analgesics
- acetaminophen + codeine (Tylenol® #3/gan) 1-2 tabs q4-6h PO/PR bid
- hydromorphone i-tabs PO q4h
- ibuprofen 200-400 mg PO q4-6h
- morphine 2.5-10 mg IM/SC q4-6h
- ketorolac (Toradol®) 30-60 mg IM/IV q6h
- Percocet® (acetaminophen/oxycodone, 325/5 mg) 1-2 tabs PO q4-6h

#### DVT Prophylaxis
- heparin 5,000 units SC bid
- enoxaparin (Lovenox®) 40 mg SC daily
- dalteparin (Fragmin®) 5,000 units SC daily

#### Antidiarrheals
- loperamide (Imodium®) 4 mg PO initially, then 2 mg PO after each loose stool up to 16 mg/d
- diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PO qid

#### Laxatives
- sennosides (Senokot®) 1-2 tabs qhs
- docusate sodium (Colace®) 100 mg PO bid
- glycerine suppository 1 tab PR bid
- lactulose 15-30 mL PO qid
- milk of magnesia (MOM) 30-60 mL PO qid
- bisacodyl (Dulcolax®) 10-15 mg PO qm

#### Sedatives
- zopiclone (Imovane®) 5-7.5 mg PO qhs
- lorazepam (Ativan®) 0.5-2 mg PO/SL qhs

#### Antibiotics
- cefazolin (Ancef®) 1 g IV/IM on call to OR or q6h – GP except Enterococcus, GN only. E. coli, Klebsiella, and Proteus
- cefalexin (Keflex®) 250-500 mg PO qid – Staphylococci, GN only. E. coli, Klebsiella, and Proteus
- ceftriaxone 1-2 g IM/IV q24h – broad coverage including Pseudomonas
- ampicillin 1-2 g IV q4-6h – Staphylococci except Enterococcus and E. coli, oral anaerobes except Bacteroides
- gentamicin 3-5 mg/kg IM/IV divided q8h – monitor creatinine, gentamicin levels – GN including Pseudomonas
- ciprofloxacin 400 mg IV q12h, 500 mg PO bid – GN including Pseudomonas
- metronidazole (Flagyl®) 500 mg PO/IV bid (500 mg PO tid for C. difficile) – anaerobes
- clindamycin 600-900 mg IV q6h, 150-400 mg PO qid – GP except Enterococcus, anaerobes
- piperacillin/tazobactam 4.5 mg IV q6h – GP, GN, and anaerobes
- vancomycin 1g IV q12h – GP and MRSA
- sulfa (Bactrim®/Septra®) PO bid – GP, GN including Nocardia

#### Over-the-Counter Medications
- Pepto-Bismol® (bismuth subsalicylate) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d side effects: black stools, risk of Reye’s syndrome in children
- Alka-Seltzer® (ASA + citrate + bicarbonate) 2 tabs in 4 oz water PO q6h pm, max 8 tabs
- Maalox® (aluminum hydroxide + magnesium hydroxide) 10-20 mL or 1-4 tabs PO q6h
- Tums® (calcium carbonate) 1-3 g PO q6h
- Rolaid® (calcium carbonate and magnesium hydroxide) 2-4 tabs PO q1h pm, max 12 tabs/d

Differential Diagnoses of Common Presentations

Constipation

- see Gastroenterology, G24

Definition
- less than 3 bowel movements in one wk and/or hard stools, straining, sense of blockade, needing manual maneuvers or incomplete evacuation on more than 25% of occasions for at least 12 wk (does not need to be consecutive)

Epidemiology
- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation and 1/2 of patients >80)
- in the elderly, chronic constipation may present as fecal impaction

Pathophysiology
- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

Treatment
- non-pharmacological
- increase fibre intake
- ensure adequate fluid intake
- discourage chronic laxative use
- engage in regular exercise
- review medication regime, reduce dosages or substitute
- pharmacologic
- see Common Medications, GM11

Figure 1. Treatment algorithm for the management of chronic constipation in the elderly

Adapted from: Clin Interv Aging 2010;5:163-171

Common Causes of Constipation Include:
- Electrolyte abnormalities (hypokalemia, hypercalcemia)
- Endocrine (hypothyroidism, DM)
- GI (IBS, colon cancer)
- Neurologic (multiple sclerosis, Parkinson’s disease)
- Psychiatric (depression, dementia)
- Other (dehydration, immobility)

Drugs Associated with Constipation Include:
- Analgesics (narcotics, NSAIDs)
- Anticholinergics
- Calcium channel blockers
- Diuretics
- Supplements (iron or calcium)

Treatment of Constipation in Older Adults

CMAJ 2013;185(8):663-70

Objectives: To discuss management of constipation in older adults.

Results/Conclusions: In older adults, the predominant symptom of constipation is more frequently straining than decreased stool frequency. RCTs support the use of osmotic agents to treat symptoms of constipation in older adults. In contrast, evidence supporting the use of bulk agents, stool softeners, stimulants, and prokinetic agents is lacking, limited and inconsistent.
Delirium, Dementia, and Depression

- see Psychiatry, PS19, PS20, PS10 and Neurology, N20

Definition
- all of the above may present with pathologic decrease in memory, language, or executive function

Differential Diagnosis
- delirium, dementia, or pseudodementia of depression (see Psychiatry)

Delirium Prevention in Elderly
- ensure optimal vision and hearing to support orientation (e.g. appropriate eye wear and hearing aids)
- provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- encourage regular mobilization to build and maintain strength, balance, and endurance
- avoid unnecessary medications and monitor for drug interactions
- avoid bladder catheterization if possible
- ensure adequate sleep

Elder Abuse

Definition
- includes physical abuse, sexual abuse, emotional/psychological abuse, financial abuse, abandonment, and neglect
- elder abuse is a criminal offence under the Criminal Code of Canada
- in the U.S., most states have criminal penalties for elder abuse

Epidemiology
- in Canada in 2013, almost 3000 seniors were victims of family violence. The perpetrators of family violence against seniors were identified to be their grown child (43% of cases) and their spouses (28% of the cases)
- in Canada in 2013, the rate of family-related homicides against seniors was 3.2 for every 1 million seniors
- in the U.S., estimates of the frequency of elder abuse range from 3-8%
- physician reporting is mandatory only in Newfoundland, Nova Scotia, and Prince Edward Island; in Canada in 2013, almost 3000 seniors were victims of family violence. The perpetrators of family violence against seniors were identified to be their grown child (43% of cases) and their spouses (28% of the cases)
- in Canada in 2013, almost 3000 seniors were victims of family violence. The perpetrators of family violence against seniors were identified to be their grown child (43% of cases) and their spouses (28% of the cases)

Risk Factors

Table 3. Risk Factors for Elder Abuse

<table>
<thead>
<tr>
<th>Situational Factors</th>
<th>Isolation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Unstable or unsafe living arrangements</td>
</tr>
<tr>
<td></td>
<td>Lack of family, community or living facility resources for additional care</td>
</tr>
</tbody>
</table>

Victim Characteristics
- Physical or emotional dependence on caregiver
- Lack of close family ties
- History of family violence
- Dementia or recent deterioration in health

Perpetrator Characteristics
- Related to victim
- Living with victim
- Long duration of care for victim (mean 9.5 yr)
- Financial, marital, occupational or other stressors

Caregiver Abuse Screen (CASE)

- instructions
  - to be answered by caregivers, if answer "yes" to a question, further explore issue
  - the more "yes" responses, the more likely the presence of abuse
  - screening tool
  - please answer the following questions as a helper/caregiver:
  1. Do you sometimes have trouble making ______ control his/her temper or aggression?
  2. Do you often feel you are being forced to act out of character/do things you feel badly about?
  3. Do you find it difficult to manage ______’s behaviour?
  4. Do you sometimes feel that you are forced to be rough with ______?
  5. Do you sometimes feel that you can’t do what is really necessary or what should be done for ______?
  6. Do you often feel you have to reject/ignore ______?
  7. Do you often feel so tired and exhausted that you cannot meet ______’s needs?
  8. Do you often feel you have to yell at ______?

From: NICE. Case: Caregiver Abuse Screen. 2010. Reproduced with permission from NICE.
Management
- assess safety and determine capacity to make decisions about living arrangements
- establish need for hospitalization or alternate accommodation (e.g. immediate risk of physical harm by self or caregiver)
- involve multidisciplinary team (e.g. nurse, social worker, family members, and physicians including geriatrician, psychiatrist or family physician)
- educate and assist caregiver, contact local resources (e.g. legal aid, crisis support, PSW, caregiver support groups)
- interpret critical and lab findings that are key in exclusion, differentiation and diagnosis

Falls

Definition
- an event which results in a person coming to rest inadvertently on the ground or floor or other lower level

Epidemiology
- 30-40% of people >65 yr old and ~50% of people >80 yr old fall each year
  - equally common between men and women, but more likely to result in injury in women and death in men
  - 5% of falls lead to hospitalization
  - falls are the leading cause of death from injury in persons older than 65 yr
  - 25% associated with serious injuries (e.g. hip fracture, head injury, bruises, laceration)
  - between 25-75% do not recover to previous level of ADL function
  - mortality increases with age (171/100,000 in men >85 yr old) and type of injury (25% with hip fracture die within 6 mo)

Etiology
- multifactorial
  - extrinsic
    - environmental (e.g. home layout, lighting, stairs, overcrowding)
    - accidental, abuse
    - side effects of medications and substance abuse (e.g. alcohol)
  - ace illness, exacerbation of chronic illness
- intrinsic
  - orthostatic/syncopal
  - age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)

Investigations
- directed by history and physical
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose, Ca\(^{++}\), TSH, B12, urinalysis, cardiac enzymes, ECG, CT head

Prevention
- multidisciplinary, multifactorial, health, and environmental risk factor screening and intervention programs in the community
- muscle strengthening, balance retraining, and group exercise programs (e.g. Tai Chi)
- home hazard assessment and modification (e.g. remove rugs, add shower bars, etc.)
- prescription of vitamin D 1000 IU daily
- tapering or gradually discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight and footwear optimization

Red Flags for Elder Abuse
- Delay in seeking medical attention
- Disparity in histories
- Implausible or vague explanations
- Frequent emergency room visits for exacerbations of chronic disease despite plan for medical care and adequate resources
- Presentation of functionally impaired patient without designated caregiver
- Lab findings inconsistent with history

Key Physical Findings in the Elderly Patient

Who Falls or Nearly Falls
I HATE FALLING
Inflammation of joints
Hypotension (orthostatic changes)
Auditory and visual abnormalities
Tremor
Equilibrium (balance) problem
Foot Problems
Arrhythmia, heart block or valvular disease
Leg-length discrepancy
Lack of conditioning (generalized weakness)
Illness
Nutrition
Gait disturbance
Am Fam Phy 2001;61:2159-2172

A history of falls within the past 1-2 yr is a predictor of motor vehicle crashes in the older population. These patients should be evaluated on their ability to drive and counseled about driving

Drugs That May Increase the Risk of Falling
- Sedative-hypnotic and anxiolytic drugs (especially long-acting benzodiazepines)
- Antidepressants (including MAOIs, SSRIs, TCAs)
- Antipsychotics and tranquilizers (phenothiazines and butyrophenones)
- Antihypertensive drugs
- Antihypertensive drugs (Class IA)
- Diuretics
- Systemic corticosteroids
- NSAIDs
- Anticholinergic drugs
- Hypoglycemic agents
- Alcohol
Adapted from: Am Fam Phy 2001;61:2159-2172

Fall Prevention Tips
- Improve lighting, especially on stairs
- Caution while adjusting to new bifocal prescription (poor depth perception)
- Side rails in bathtubs
- Railings on steps
- Connect patient to lifeline button signaling systems
- Remove loose mats or carpets, telephone cords and other tripping hazards
- Recommend support hose for varicose veins and swelling of ankles
Essential Geriatrics: Managing 6 Conditions. Patient Care Canada 1987;8
**Frailty (Functional Decline/Failure to Thrive)**

**Definition**
- frailty - clinical state of older adults with increased vulnerability to acute stressors resulted from functional decline
- functional decline - progressive limitation in the ability to carry out basic functional activities
- failure to thrive - a state of decline that may be characterized by weight loss, decreased appetite, poor nutrition, and inactivity

**Etiology**
- multifactorial - malnutrition, functional impairment, cognitive impairment, and depression

**Table 4. Common Medical Conditions Associated with Failure to Thrive**

**Figure 2. Approach to falls in the elderly**

Adapted from: Davuluri S, Dharanraj T. Clinical Geriatrics 2013;21(10)

**Will My Patient Fall?**

*JAMA* 2007;297:77-86

**Purpose:** To identify the prognostic value of risk factors for future falls among older patients.

**Study Selection:** Meta-analysis of prospective cohort studies of risk factors for falls.

**Results:** 18 studies were included. Clinically identifiable risk factors were identified across 6 domains: orthostatic hypotension, visual impairment, impairment of gait or balance, medication use, limitations in basic or instrumental activities of daily living, and cognitive impairment. The estimated prettest probability of falling at least once in any given yr for individuals 65 yr and older was 27% (95% CI 19-36%). Patients who have fallen in the past yr are more likely to fall again (LR2.3-2.8). Best predictors of future falls were disturbances in gait of balance (LR 1.7-2.4), while visual impairment, impaired cognition, and medication were not reliable predictors.

**Conclusions:** Screening for risk of falling during the clinical examination begins with determining if the patient has fallen in the past yr. For patients who have not previously fallen, screening consists of an assessment of gait and balance. Patients who have fallen or who have a gait or balance problem are at higher risk of future falls.
Fecal Incontinence

Definition
- Involuntary passage or the inability to control the discharge of fecal matter through the rectum.
- Severity can range from unintentional flatus to the complete evacuation of bowel contents.
- There are three subtypes:
  1. Passive incontinence: involuntary discharge of stool or gas without awareness.
  2. Urgency incontinence: discharge of fecal matter in spite of active attempts to retain bowel contents.
  3. Fecal: leakage of stool following otherwise normal evacuation.

Epidemiology
- Second leading cause of nursing home placement.
- US estimates show that 10-25% of hospitalized geriatric patients suffer from fecal incontinence.

Etiology
- Commonly multifactorial
  - Structural abnormalities
  - Trauma (e.g., prior vaginal delivery, surgery).
  - Prolapse
  - Tumour/trauma (e.g., brain, spinal cord, cauda equina).
  - Overflow (e.g., encopresis, impaction).
- Functional abnormalities
  - Neuropathic conditions – neuropathy, multiple sclerosis, stroke, dementia.
- Others
  - Constipation with overflow may be a factor.
  - Psychosis (willful soiling).
  - Age >80 yr: decreased external sphincter strength and weak anal squeeze, increased rectal compliance, decreased resting tone and internal sphincter, impaired anal sensation.
  - Medications (e.g., laxatives, anticholinergics, antidepressants, caffeine, muscle relaxants).

Differential Diagnoses of Common Presentations Toronto Notes 2017GM7   Geriatric Medicine

Figure 3. Failure to thrive in elderly patients
Adapted from: American Family Physician 2004;70:343-350
Investigations (if cause not apparent from history and physical)
- differentiate true incontinence from frequency and urgency (i.e. IBS, IBD)
- stool studies
- endorectal ultrasound
- colonoscopy, sigmoidoscopy, anoscopy
- anorectal manometry/functional testing

Management
- diet/bulking agent if stool is liquid or loose
- disimpaction, prevent impaction
- anti-diarrheal agents (e.g. loperamide)
- regular defecation program in patients with dementia
- counsel about biofeedback therapy (retraining of pelvic floor muscles)

URINARY INCONTINENCE
- see Urology, U5

Definition
- complaint of any involuntary loss of urine
- can be further classified according to patients symptoms as urgency urinary incontinence, stress urinary continence, mixed urinary incontinence, nocturnal enuresis, post-micturition dribble, and continuous urinary leakage

Epidemiology
- 15-30% prevalence dwelling in community and at least 50% of institutionalized seniors
- morbidity: cellulitis, pressure ulcers, urinary tract infections, falls with fractures, sleep deprivation, social withdrawal, depression, sexual dysfunction
- not associated with increased mortality

Pathophysiology
- not a normal part of aging, urinary incontinence is a loss of control due to a combination of:
  - genitourinary pathology: increased post-void residual volume, increased involuntary bladder contractions (urge incontinence)
  - age-related changes: decreased bladder capacity
  - comorbid conditions and medications
  - functional impairment
- in elderly women: decline in bladder outlet and urethral resistance pressure promoting stress incontinence
- in elderly men: prostatic enlargement can cause overflow and urge incontinence

Gait Disorders
- see Neurology, N10

Hazards of Hospitalization

Table 5. Recommendations for Sequelae of Hospitalization in Older Patients

<tr>
<td>Decreased respiratory function</td>
<td>Incentive spirometry, physiotherapy</td>
</tr>
</tbody>
</table>

Hypertension

- see Family Medicine, FM34

Definition
- blood pressure at which an otherwise healthy person would have increased risk of cardiovascular disease
- definition of high blood pressure has changed over time and differs between guidelines proposed by expert bodies
- target: <140/90 mm Hg for adults younger than 80, <130/80 mm Hg for individuals with DM, <150/90 mm Hg for adults aged 80 or older

Epidemiology
- 60%-80% of elderly (>65 yr old) have hypertension
  - 60% of these have isolated systolic HTN
  - the benefit of treating hypertension in the elderly is 2-4 times greater than that achieved in the treatment of younger patients with primary hypertension
  - systolic and pulse pressure are major predictors of outcome in the elderly patient
  - in older adults, base treatment on sBP

Management
- non-pharmacologic treatments are first-line, then thiazide or thiazide-like diuretic monotherapy is recommended in patients without comorbidities
- add ACEI/ARB if also atherosclerosis, DM, CHF or chronic kidney disease
- add β-blockers if also angina or CHF

Immobility

Complications
- cardiovascular: orthostatic hypotension, venous thrombosis, embolism
- respiratory: decreased ventilation, atelectasis, pneumonia
- gastrointestinal: anorexia, constipation, incontinence, dehydration, malnutrition
- genitourinary: infection, urinary retention, bladder calculi, incontinence
- musculoskeletal: atrophy, contractures, bone loss
- skin: pressure ulcers
- psychological: sensory deprivation, delirium, depression

Immunizations

- the following immunizations are recommended for people 65 yr of age and older
  - tetanus: every 10 yr
  - pneumococcus: every 5 yr
  - influenza: every autumn
  - herpes zoster: Zostivax

Malnutrition

Definition
- involuntary weight loss of ≥5% baseline body weight or ≥5 kg
- hypoalbuminemia, hypocholesterolemia

Etiology
- nutritional
  - decreased assimilation: impaired transit, maldigestion, malabsorption
  - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)
  - stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
  - mechanical: dental problems, dysphagia
  - age-related changes: appetite dysregulation, decreased thirst
  - mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

Clinical Features
- history
  - recent or chronic illness
    - depression, GI symptoms

Etiology of Malnutrition in the Elderly

MEALS ON WHEELS
- Medications
- Emotional problems
- Anorexia
- Late-life paranoia
- Swallowing disorders
- Oral problems
- Neocarcinomatous infections
- Wandering/dementia related activity
- Hyperthyroidism/Hypercorticism/Hypoadrenalism
- Emetic disorders
- Eating problems
- Low-salt/Low-fat diet
- Stones

Remember to Calculate BMI
- BMI outside 22-27 kg/m² is a health risk
• functional disability: impaired ADLs and IADLs
• social factors: economic barriers, dental problems and living situation (e.g. living alone)
• constitutional symptoms (e.g. recent weight loss)
• physical exam
  • BMI <23.5 in males, <22 in females should raise concern
  • temporal wasting, muscle wasting, presence of triceps skin fold
  • assess cognition

Investigations
• CBC, electrolytes, Ca++, Mg++, PO4-, creatinine, LFTs (albumin, INR, bilirubin), B12, folate, TSH, transferrin, lipid profile, urinalysis, ESR, CXR

Treatment
• direct treatment at underlying causes
• dietary modification: high calorie foods, oral nutritional supplementation

Osteoporosis
• see Endocrinology, E40

Presbycusis
• see Otolaryngology, OT19

Pressure Ulcers
• see Plastic Surgery, PL16

Risk Factors
• extrinsic factors: friction, pressure, shear force
• intrinsic factors: immobility, malnutrition, moisture, sensory loss

Table 6. Classification of Pressure Ulcers

<table>
<thead>
<tr>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Changes include skin temperature, tissue consistency or sensation. An area of persistent erythema in lightly pigmented, intact skin; in darker skin, it may appear red, blue or purple.</td>
</tr>
<tr>
<td>II</td>
<td>Partial thickness skin loss involving the epidermis, dermis or both. The ulcer is superficial and presents as an abrasion, blister or shallow crater.</td>
</tr>
<tr>
<td>III</td>
<td>Full thickness skin loss involving damage or necrosis of subcutaneous tissue which may extend down to, but not through, underlying fascia. Presents as a deep crater with or without undermining of adjacent tissue.</td>
</tr>
<tr>
<td>IV</td>
<td>Full thickness skin loss with extensive destruction, tissue necrosis or damage to muscle, bone or supporting structures. May have associated undermining and/or sinus tracts.</td>
</tr>
</tbody>
</table>

Prevention
• pressure reduction
  • frequent repositioning
  • pressure-reducing devices (static, dynamic)
  • maintaining nutrition, encouraging mobility and managing incontinence

Treatment
• optimize nutritional status
• minimize pressure on wound
• analgesia
• wound debridement (mechanical, enzymatic, autolytic) and dressing application
• maintain moist wound environment to enable re-epithelialization
• treatment of wound infections (topical gentamicin, silver sulfadiazine, mupirocin)
• swab wounds not demonstrating clinical improvement for C&S; biopsy chronic wounds to rule out malignancy
• stage IV ulcers typically warrant surgical debridement
• consider other treatment options
  • negative pressure wound therapy/vacuum-assisted closure (VAC)
  • biological agents: application of fibroblast growth factor, platelet-derived growth factor to wound
  • non-contact normothermic wound therapy
  • electrotherapy

Calculating Basic Caloric and Fluid Requirements

**WHO daily energy estimates for adults**

**Male:**

\[ 13.5 \times (weight \text{ in kg}) + 487 \]

**Female:**

\[ 10.5 \times (weight \text{ in kg}) + 596 \]

Maintenance fluid requirements for the elderly without cardiac or renal disease: 1500-2500 cc/24 h
Driving Competency

Reporting Requirements

- physician-reporting to the Ministry of Transportation is mandatory in all provinces and territories except in Quebec, Nova Scotia, and Alberta, where it is discretionary
- not an issue unique to geriatrics – any patient may suffer from a medical condition that impairs their ability to drive should be reported
- in the U.S., varies by state

Conditions that may Impair Driving

**Table 7. Conditions that Impair Driving**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Impairment Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alcohol</td>
<td>Patients with history of impaired driving and those with high probability of future impaired driving should not drive until further assessed. Alcohol dependence or abuse: if suspected, should be advised not to drive. Alcohol withdrawal seizure: must complete a rehabilitation program and remain abstinent and seizure-free for 6 mo before driving.</td>
</tr>
<tr>
<td>Blood Pressure Abnormalities</td>
<td>Hypertension: sustained BP &gt;170/110 should be evaluated carefully. Hypotension: if syncopal, discontinue until attacks are treated and preventable.</td>
</tr>
<tr>
<td>Cardiovascular Disease</td>
<td>Suspected asymptomatic CAD or stable angina: no restrictions. STEMI, NSTEMI with significant LV damage, coronary artery bypass surgery: no driving for one mo following hospital discharge. NSTEMI with minor LV damage, unstable angina: no driving for 48 h if percutaneous coronary intervention (PCI) performed or 7 d if no PCI performed.</td>
</tr>
<tr>
<td>Cerebrovascular Conditions</td>
<td>TIA: should not be allowed to drive until a medical assessment is completed. Stroke: should not drive for at least one mo; may resume driving if functionally able, no clinically significant motor, cognitive, perceptual or vision deficits; no obvious risk of sudden recurrence; underlying cause appropriately treated; no post-stroke seizure.</td>
</tr>
<tr>
<td>COPD</td>
<td>Mild/moderate impairment: no restrictions. Moderate or severe impairment requiring supplemental oxygen: road test with supplemental oxygen.</td>
</tr>
<tr>
<td>Cognitive Impairment/Dementia</td>
<td>Moderate to severe dementia is a contraindication to driving: defined as the “inability to independently perform 2 or more IADLs or any basic ADL.” Patients with mild dementia should be assessed, if indicated, refer to specialized driving testing centre; if deemed fit to drive, re-evaluate patient every 6-12 mo. Poor performance on MMSE, clock drawing or Trails B suggests a need to investigate driving ability further. MMSE score alone (whether normal or low) is insufficient to determine fitness to drive.</td>
</tr>
<tr>
<td>Diabetes</td>
<td>Diet controlled or oral hypoglycemic agents: no restrictions in absence of diabetes complications that may impair ability to drive (e.g. retinopathy, nephropathy, neuropathy, cardiovascular or cerebrovascular disease). Insulin use: may drive if no complications (as above) and no severe hypoglycemic episode in the last 6 mo.</td>
</tr>
<tr>
<td>Drugs</td>
<td>Be aware of: analgesics, anticholinergics, anticonvulsants, antidepressants, antipsychotics, opiates, sedatives, stimulants. Degree of impairment varies: patients should be warned of the medication/withdrawal effect on driving.</td>
</tr>
<tr>
<td>Hearing Loss</td>
<td>Effect of impaired hearing on ability to drive safely is controversial. Acute labyrinthitis, positional vertigo with horizontal head movement, recurrent vertigo: advise not to drive until condition resolves.</td>
</tr>
<tr>
<td>Musculoskeletal Disorders</td>
<td>Physician’s role is to report etiology, prognosis and extent of disability (pain, range of motion, coordination, muscle strength)</td>
</tr>
<tr>
<td>Post-Operative</td>
<td>Outpatient, conscious sedation: no driving for 24 h. Outpatient, general anesthesia: no driving for &gt;24 h.</td>
</tr>
<tr>
<td>Seizures</td>
<td>First, single, unprovoked: no driving for 3 mo until complete neurologic assessment, EEG, CT head. Epilepsy: can drive if seizure-free on medication and physician has insight into patient compliance.</td>
</tr>
<tr>
<td>Sleep Disorders</td>
<td>If patient is believed to be at risk due to a symptomatic sleep disorder but refuses investigation with a sleep study or refuses appropriate treatment, the patient should not drive.</td>
</tr>
<tr>
<td>Visual Impairment</td>
<td>Visual acuity: contraindicated to drive if &lt;20/50 with both eyes examined simultaneously. Visual field: contraindicated to drive if &lt;120° along horizontal meridian and 15° continuous above and below fixation with both eyes examined simultaneously.</td>
</tr>
</tbody>
</table>

N.B. guidelines included refer specifically to private driving; please see CMA guidelines for commercial driving.

Key Factors to Consider in Older Drivers

- SAFEDRIVE
  1. Unpaired vision
  2. Adequate cognition
  3. Ability to maintain consciousness
  4. Physical mobility (e.g. mobility of arms/legs/neck)

Simplified Functional Approach to Driving Assessment

- Visual acuity: contraindicated to drive if <20/50 with both eyes examined simultaneously
- Visual field: contraindicated to drive if <120° along horizontal meridian and 15° continuous above and below fixation with both eyes examined simultaneously

Systematic Review of Driving Risk and the Efficacy of Compensatory Strategies in Persons with Dementia

**Purpose:** To determine whether persons with dementia are at greater driving risk and, if so, to estimate the magnitude of this risk and determine whether there are efficacious methods to compensate for or accommodate it.

**Study Selection:** Systematic review of the case-control studies of drivers with a diagnosis of dementia.

**Results:** Drivers with dementia universally exhibited poorer performance on road tests and simulator evaluations. The one study that used an objective measure of motor vehicle crashes found that the crash risk in persons with dementia was 2-2.5 times greater than matched controls. No studies were found that examined the efficacy of methods to compensate for or accommodate the decreased driving performance.

**Conclusions:** Drivers with dementia are poorer drivers than cognitively normal drivers, but studies have not consistently demonstrated higher crash rates. Clinicians and policy makers must take these findings into account when addressing issues pertinent to drivers with a diagnosis of dementia.
Health Care Institutions

Table 8. Classification of Health Care Services and Institutions

<table>
<thead>
<tr>
<th>Institution/Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community Support Services</td>
<td>Health care services offered at home for those who can live independently at home or under the care of family members including professional health care services, personal care and support (ADL assistance), homemaking (IADL assistance), community support services (e.g. transportation, meal delivery, day programs, caregiver relief, security checks, etc.)</td>
</tr>
<tr>
<td>Rehabilitation</td>
<td>Health care services offered in an institution to optimize patients’ function, independence and quality of life</td>
</tr>
<tr>
<td>Residential</td>
<td></td>
</tr>
<tr>
<td>a) Seniors Affordable Housing</td>
<td>Seniors who live independently and manage their own care but prefer to live near other seniors; usually has accessibility features and rent is adjusted based on income</td>
</tr>
<tr>
<td>b) Retirement/Nursing Home</td>
<td>Residents are fairly independent and require minimal support with ADLs and IADLs; often privately owned</td>
</tr>
<tr>
<td>c) Supportive Housing</td>
<td>Residents require minimal to moderate assistance with daily activities while living independently; often rental units in an apartment and may offer some physiotherapy and rehabilitation services</td>
</tr>
<tr>
<td>d) Long-term Care/Skilled Nursing Facility</td>
<td>Around the clock nursing care and on-call physician coverage; often offers occupational therapy, physiotherapy, respiratory therapy, and rehabilitation services; may be used short-term for caregiver respite or for supportive patient care to regain strength and confidence after leaving the hospital</td>
</tr>
<tr>
<td>e) Hospice</td>
<td>Free-standing facility or designated floor in a hospital or nursing home for care of terminally ill patients and their families; focus is on quality of life and often requires prognosis ≤3 mo</td>
</tr>
</tbody>
</table>

- names of community health care institutions, types of facilities, and services offered vary between geographical locations
- factors to consider when seeking services/institutions include level of care required, support networks, duration of stay, and cost

Palliative and End-of-Life Care

Principles and Quality of Life

- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

End-of-Life Care Discussions

When to Initiate End-of-Life Care Discussions

- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient inquires about end-of-life care

Suggested Topics for Discussion

- goals of care (disease vs. symptom management)
- advance directives, power of attorney, public guardian and trustee
- treatment options and likelihood of success
- common medical interventions
  - mechanical ventilation
  - antibiotic therapy
  - feeding tubes
- resuscitation options and likelihood of success (Full Code vs. DNR status including preferences for CPR, intubation, ICU admission, artificial hydration)

Power of Attorney

- see Ethical, Legal, and Organizational Medicine, ELOM9
### Instructional Advance Directives

- see *Ethical, Legal, and Organizational Medicine, ELOM9*

### Symptom Management

#### Assessment Tools

- **Edmonton Symptom Assessment System (ESAS):** a tool that asks patients to rate the intensity of symptoms from 0 to 10 and allows for tracking of the efficacy of interventions. Assesses: pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well-being, shortness of breath, and “other problems”
- **Palliative Performance Scale (PPS):** a tool that uses functional status to predict survival in terminally ill patients. Assesses 5 components: ambulation, activity and evidence of disease, self-care, intake and conscious level

*Source: J Palliat Care 1991;7:6-9 and Victoria Hospice Society 2006;120-121*

#### Table 9. Management of Common End-of-Life Symptoms

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Non-Pharmacologic Management</th>
<th>Pharmacologic Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constipation</td>
<td>Rule out obstruction, impaction, anorectal disease; hydration and high fibre intake; increase mobility</td>
<td>Stop unnecessary opioids and medications with anticholinergic side effects; provide stool softener (e.g. docusate sodium), increase peristalsis (e.g. senna), alter water and electrolyte secretion (e.g. magnesium hydroxide, lactulose, peg3350) Multiply by 0.85 for females</td>
</tr>
</tbody>
</table>
| Death Rattle/Increased Pulmonary Secretions | Oral suctioning  
Discontinue unnecessary IV solutions | Scopolamine SC or transdermal octreotide |
| Dry mouth              | Oral hygiene q2h, ice cubes, sugarless gum  
Artificial saliva substitutes, bethanechol, pilocarpine 1% solution as mouth rinse | |
| Dysphagia              | Frequent small feeds, ideally seated, keep head of bed elevated for 30 min after eating, suction as necessary | Treat painful mucositis (diphenhydramine: lidocaine: Maalox® in a 1:2:8 mixture), candidiasis (fluconazole) |
| Dyspnea                | Elevate head of bed, eliminate allergens, open window/use fan | Oxygen, bronchodilators, opioids (e.g. morphine, hydromorphone) |
| Hiccups                | Dry sugar, breathing in paper bag | Chlorpromazine, haloperidol, metoclopramide, baclofen, marijuana |
| Nausea and Vomiting    | Frequent and small meals, avoid offensive strong odours, treat constipation if present | Raised ICP: dexamethasone  
Anticipatory nausea, anxiety: lorazepam  
Vestibular disease, vertigo: dimenhydrinate  
Drug induced, hepatic or renal failure: prochlorperazine, haloperidol  
GERD: PPI or H2 antagonist  
Gastric stasis: metoclopramide  
Bowel obstruction: metoclopramide, dexamethasone, octreotide |
| Pain                   | Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance, and cognitive behavioural therapy (CBT) | Nociceptive pain: non-opioids (NSAIDs, acetaminophen), weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl)  
Neuropathic pain: anticonvulsants (gabapentin, pregabalin), antidepressants (TCAs, SSRIs), steroids (dexamethasone)  
Bony pain: non-opioids, weak opioids, bisphosphonates, radiation therapy |
| Pruritus                | Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice  
Antihistamines, phenothiazines, topical corticosteroids, calamine lotion | |
| Weakness               | Modify environment and activities to decrease energy expenditure | Treat insomnia, anemia, depression; consider psychostimulants |

**Geriatric Pharmacology**

### Pharmacokinetics

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Age Effect</th>
<th>Implications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absorption</td>
<td>Increased gastric pH</td>
<td>Drug-drug and drug-food interactions are more likely to affect absorption</td>
</tr>
<tr>
<td></td>
<td>(less significant)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Decreased splanchnic blood flow, GI absorptive surface and dermal vascularity; delayed gastric emptying</td>
<td></td>
</tr>
<tr>
<td>Distribution</td>
<td>Increased total body fat and α1-glycoprotein</td>
<td>Lipophilic drugs have a larger volume of distribution</td>
</tr>
<tr>
<td></td>
<td>Decreased lean body mass, total body water, and albumin</td>
<td>Lower doses may be therapeutic</td>
</tr>
<tr>
<td></td>
<td>(less significant)</td>
<td></td>
</tr>
<tr>
<td>Metabolism</td>
<td>Decreased hepatic mass and hepatic blood flow; impaired phase I reactions (oxidative system)</td>
<td>For every x% reduction in clearance, decrease the dose by x% and increase the interval by x%</td>
</tr>
<tr>
<td>Elimination</td>
<td>Decreased renal blood flow, GFR, tubular secretion and renal mass</td>
<td></td>
</tr>
</tbody>
</table>

**Pharmacodynamics**

**Drug Sensitivity**
- changes in pharmacokinetics as well as intrinsic sensitivity lead to altered drug responses
- increased sensitivity to warfarin, sedatives, antipsychotics, digoxin and narcotics
- decreased sensitivity to β-blockers in majority of elderly patients, though some may have increased sensitivity

**Decreased Homeostasis**
- poorer compensatory mechanisms leading to more adverse reactions (e.g. bleeding with NSAIDs/anticoagulants, altered mental status with anticholinergic/sympathomimetic/anti-Parkinsonian drugs)

**Polypharmacy**

**Definition**
- prescription, administration or use of five or more medications at the same time

**Epidemiology**
- in Canada, > 60% of elderly individuals reported using ≥5 medications
- hospitalized elderly are given an average of 10 medications during admission

**Risk Factors for Non-Compliance**
- risk of non-compliance correlates with medication factors, not age
  - number of medications: compliance with 1 medication is 80%, but drops to 25% with ≥6 medications
  - increased dosing frequency, complicated container design, financial constraints, and cognitive impairment

**Adverse Drug Reactions (ADRs)**
- any noxious or unintended response to a drug that occurs at doses used for prophylaxis or therapy
- risk factors in the elderly
  - intrinsic: comorbidities, age-related changes in pharmacokinetics and pharmacodynamics
  - extrinsic: number of medications, multiple prescribers, unreliable drug history
- 90% of ADRs are from: ASA, analgesics, anticoagulants, antimicrobials, antineoplastics, digoxin, diuretics, hypoglycemics, and steroids

**Preventing Polypharmacy**
- consider drug: safer side effect profiles, convenient dosing schedules, convenient route, efficacy
- consider patient: other medications, clinical indications, medical comorbidities
- consider patient-drug interaction risk factors for ADRs
- review drug list regularly to eliminate medications with no clinical indication or with evidence of toxicity
- avoid treating an ADR with another medication
# Inappropriate Prescribing in the Elderly

## Epidemiology
- the estimated prevalence of potentially inappropriate prescribing ranges from 12–40%

## Beers Criteria
- a list of medications to avoid in adults 65 yr and older due to safety concerns
- examples include long-acting benzodiazepines, strong anticholinergics, high-dose sedatives
- the elderly are also under-treated (ACEI, ASA, β-blockers, thrombolytics, warfarin)

## Table 1. Common Medications

References ....................................................... 52
A. EXTERNAL GENITALIA
- referred to collectively as the vulva
- blood supply: internal pudendal artery
- sensory innervation: pudendal nerve
- lymphatic drainage: inguinal nodes

B. VAGINA
- muscular canal extending from cervix to vulva, anterior to rectum and posterior to bladder
- lined by rugated, stratified-squamous epithelium
- upper vagina separated by cervix into anterior, posterior, and lateral fornices
- blood supply: vaginal branch of internal pudendal artery with anastomoses from uterine, inferior vesical, and middle rectal arteries

C. UTERUS
- thick walled, muscular organ between bladder and rectum, consisting of two major parts:
  - uterine corpus
  - cervix
- blood supply: cervical branch of uterine artery
- supported by the pelvic diaphragm, the pelvic organs, and 4 paired sets of ligaments
  - round ligaments: travel from anterior surface of uterus, through broad ligaments, and inguinal canals then terminate in the labia majora
    - function: anteversion
  - blood supply: Sampson's artery (branch of uterine artery running through round ligament)
  - uterosacral ligaments: arise from sacral fascia and insert into posterior inferior uterus
    - function: mechanical support for uterus and contain autonomic nerve fibres
  - cardinal ligaments: extend from lateral pelvic wall to insert into lateral cervix and vagina
    - function: mechanical support, prevent prolapse
  - broad ligaments: pass from lateral pelvic wall to the bladder
    - function: maintain position of uterus
  - infundibulopelvic ligament: continuous tissue that connects ovary to pelvic wall
    - contains the ovarian artery, ovarian vein, ovarian plexus, and lymphatic vessels
- position of the uterus
  - anteverted (majority), retroverted, neutral
D. FALLOPIAN TUBES
- 8-14 cm muscular tubes extending laterally from the uterus to ovary
- interstitial, isthmic, ampullary, and infundibular segments; terminates at fimbriae
- mesosalpinx: peritoneal fold that attaches fallopian tube to broad ligament
- blood supply: uterine and ovarian arteries

E. OVARIIES
- consist of cortex with ova and medulla with blood supply
- supported by infundibulopelvic ligament (suspensory ligament of ovary)
- mesovarium: peritoneal fold that attaches ovary to broad ligament
- blood supply: ovarian arteries (branches off aorta), left ovarian vein (drains into left renal vein), right ovarian vein (drains into inferior vena cava)
**Menstrual Cycle**

</tr>
<tr>
<td>Cervical Mucus</td>
<td>Cervical mucus: Clear, ↑ amount, Spinnbarkeit 8-10 cm, more stringy</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CHARACTERISTICS**
- Menarche 10-15 yr
- Average 12.2 yr
- Entire cycle 28 ± 7 d with bleeding for 1-6 d
- 25-80 mL blood loss per cycle

**ESTROGEN**
- Estrogen is the main hormone in the follicular/proliferative phase and is stimulated by $FSH$. As the level increases it acts negatively on $FSH$. The majority of estrogen is secreted by the dominant follicle.
- Effects:
  - On the follicles in the ovaries
  - On the endometrium
  - Proliferation of glandular and stromal tissue
  - On all target tissues
  - Decreases $E$ receptors

**PROGESTERONE**
- Progesterone is the main hormone in the luteal/secretory phase and is stimulated by $LH$. Increased progesterone acts negatively on $LH$ and is secreted by the corpus luteum (remnant of dominant follicle).
- Effects:
  - On the endometrium:
    - Cessation of mitoses (stops building endometrium up)
    - "Organization" of glands (initiates secretions from glands)
    - Inhibits macrophages, interleukin-8, and enzymes from degrading endometrium
  - On all target tissues:
    - Decrease $E$ receptors (the "anti-estrogen" effect)
    - Decrease $P$ receptors

**ESTROGEN**
- $E$ and $P$ (from end of previous cycle)
- $FSH$ acts on ovarian granulosa cells
- $E$ from follicles (ovary)

**PROGESTERONE**
- $LH$ pulse frequency
- $E$ from follicles, especially from dominant follicle
- $P$ from corpus luteum

**OVULATION**
- Sudden switch from negative to positive feedback ($E$ and $P$ now $FSH$ & $LH$)
- $LH$ pulse amplitude (LH surge)
- $P$ from corpus luteum
- $P$ secondary to degeneration of corpus luteum
Stages of Puberty

- see Pediatrics, P30
- adrenarche: increase in secretion of adrenal androgens; usually precedes gonadarche by 2 yr
- gonadarche: increased secretion of gonadal sex steroids; –age 8 yr
- thelarche: breast development
- pubarche: pubic and axillary hair development
- menarche: onset of menses, usually following peak height velocity and/or 2 yr following breast budding

Premenstrual Syndrome

- synonyms: “ovarian cycle syndrome,” “menstrual molimina” (moodiness)

Etiology

- multifactorial: not completely understood; genetics likely play a role
- CNS-mediated neurotransmitter interactions with sex steroids (progesterone, estrogen, and testosterone)
- serotonergic dysregulation – currently most plausible theory

Diagnostic Criteria for Premenstrual Syndrome

- at least one affective and one somatic symptom during the 5 days before menses in each of the three prior menstrual cycles
  - affective: depression, angry outbursts, irritability, anxiety, confusion, social withdrawal
  - somatic: breast tenderness, abdominal bloating, headache, swelling of extremities
- symptoms relieved within 4 d of onset of menses
- symptoms present in the absence of any pharmacologic therapy, drug or alcohol use
- symptoms occur reproducibly during 2 cycles of prospective recording
- patient suffers from identifiable dysfunction in social or economic performance

Treatment

- goal: symptom relief
- psychological support
- medications
  - NSAIDs for discomfort and pain
  - spironolactone for fluid retention: used during luteal phase
  - SSRIs: used during luteal phase x 14 d or continuously
  - OCP: primarily beneficial for physical/somatic symptoms
  - danazol: an androgen that inhibits the pituitary-ovarian axis
  - GnRH agonists if PMS is severe and unresponsive to treatment (may use prior to considering definitive treatment with BSO)
- mind/body approaches
  - regular aerobic exercise
  - cognitive behavioural therapy
  - relaxation, light therapy biofeedback, and guided imagery
- herbal remedies (variable evidence)
  - black cohosh, kava, ginkgo, agnus castus fruit extract
- BSO if symptoms severe

Premenstrual Dysphoric Disorder

Clinical Presentation

- irritability, depressed mood
- breast pain and bloating

Diagnostic Criteria for Premenstrual Dysphoric Disorder

- at least 5 of the following 11 symptoms during most menstrual cycles of the last year (with at least 1 of the first 4)
  - depressed mood or hopelessness
  - anxiety or tension
  - affective symptoms
  - anger or irritability
  - decreased interest in activities
  - difficulty concentrating
  - lethargy
  - change in appetite
  - hypersomnia or insomnia
  - feeling overwhelmed
  - physical symptoms: breast tenderness/swelling, headaches, joint/muscle pain, bloating, or weight gain
- symptoms interfere with social or occupational functioning
- symptoms must be discretely related to the menstrual cycle
- 1, 2 and 3 must be confirmed during at least 2 consecutive symptomatic menstrual cycles
Abnormal Uterine Bleeding

Abnormal Uterine Bleeding (AUB)
- Heavy Menstrual Bleeding (AUB-HMB)
- Intermenstrual Bleeding (AUB-IMB)

Structural Causes (PALM)
- Polyp (AUB-P)
- Adenomyosis (AUB-A)
- Leiomyoma (AUB-L)
  - Submucosal (AUB-LSM)
  - Other (AUB-LO)
- Malignancy and hyperplasia (AUB-M)

Non-Structural Causes (COEIN)
- Coagulopathy (AUB-C)
- Ovulatory dysfunction (AUB-O)
- Endometrial (AUB-E)
- Iatrogenic (AUB-I)
- Not yet classified (AUB-N)

Dysmenorrhea

- see Disorders of Menstruation, GY10
- primary/idiopathic
- secondary (acquired)
  - endometriosis
  - adenomyosis
  - uterine polyps
  - uterine anomalies (e.g. non-communicating uterine horn)
  - leiomyoma
  - intrauterine synechiae
  - ovarian cysts
  - cervical stenosis
  - imperforate hymen, transverse vaginal septum
  - pelvic inflammatory disease
  - IUD (copper)
  - foreign body

Pruritus

- see Gynecological Infections, GY25
- physiologic discharge and cervical mucus production
- non-physiologic
  - genital tract infection
  - vulvovaginitis: candidiasis, trichomoniasis, BV, polymicrobial superficial infection
  - chlamydia, gonorrhea
  - pyosalpinx, salpingitis
  - genital tract inflammation (non-infectious)
  - local: chemical irritants, douches, sprays, foreign body, trauma, atrophic vaginitis, desquamative inflammatory vaginitis, focal vulvitis
  - neoplasia: vulvar, vaginal, cervical, endometrial
  - systemic: toxic shock syndrome, Crohn’s disease, collagen disease, dermatologic (e.g. lichen sclerosis)
  - IUD, OCP (secondary to progesterone)
Pelvic Pain

Figure 7. Approach to pelvic pain

20% of chronic pelvic pain patients have a history of previous sexual abuse/assault; remember to ask about it

Pelvic Mass

Figure 8. Differential diagnosis of pelvic mass

Pyometra
Pus within the uterine cavity
Hematometra
Blood within the uterine cavity
Hydrometra
Fluid within the uterine cavity
Hematocolpos
Blood within the vagina
Dyspareunia

First and Second Trimester Bleeding

Approach to the Patient with Bleeding in T1/T2

History
- risk factors for ectopic pregnancy (see Ectopic Pregnancy, GY21)
- previous spontaneous abortion
- recent trauma
- characteristics of the bleeding (including any tissue passed)
- characteristics of the pain (cramping pain suggests spontaneous abortion)
- history of coagulopathy
- gynecological/obstetric history
- fatigue, dizziness, syncopal episodes due to hypovolemia, fever (may be associated with septic abortion)

Physical
- vitals (including orthostatic changes)
- abdomen (symphysis fundal height, tenderness, presence of contractions)
- perineum (signs of trauma, genital lesions)
- speculum exam (cervical os open or closed, presence of active bleeding/clots/tissue)
- pelvic exam (uterine size, adnexal mass, uterine/adnexal tenderness)

Investigations
- β-hCG (lower than expected for GA in spontaneous abortion, ectopic pregnancy)
- U/S (confirm intrauterine pregnancy and fetal viability)
- CBC
- group and screen

Treatment
- IV resuscitation for hemorrhagic shock
- treat the underlying cause

Common Investigations and Procedures

Imaging

Ultrasound (U/S)
- transabdominal or transvaginal U/S is the imaging modality of choice for pelvic structures
- transvaginal U/S provides better resolution of uterus and adnexal structures
- detects early pregnancy if β-hCG ≥1,500 (β-hCG must be ≥6,500 for transabdominal U/S)
- may be used to identify pelvic pathology
- identify ectopic pregnancy, intrauterine pregnancy
- assess uterine, adnexal, cul-de-sac, ovarian masses (e.g. solid or cystic)
- determine endometrial thickness, locate/characterize fibroids
- monitor follicles during assisted reproduction
- assess endometrial lining in postmenopausal women
Endometrial Biopsy

- performed in the office using an endometrial suction curette (pipelle) guided through the cervix to aspirate fragments of endometrium
  - pre-treatment with misoprostol (Cytotec®) if nulliparous or postmenopausal
- more invasive procedure (D&C) may be done in the office or operating room ± hysteroscopy. This may be required if endometrial biopsy is not possible in the office setting
- indications
  - AUB/PMB
    - age > 40
    - risk factors for endometrial cancer
    - failure of medical treatment
    - significant intermenstrual bleeding
    - consider in women with infrequent menses suggesting anovulatory cycles

Hysterectomy

Indications
- uterine fibroids
- endometriosis, adenomyosis
- uterine prolapse
- pelvic pain
- AUB
- cancer (endometrium, ovaries, fallopian tubes, cervix)

Complications
- general anesthetic
- bleeding
- infection
- injury to other organs (ureter, bladder, rectum)
- loss of ovarian function (if ovaries removed, iatrogenic menopause)

Approaches
1. open (abdominal approach): uterus removed via transverse (pfannenstiel) or midline laparotomy
2. minimally Invasive Approaches
  - vaginal: uterus removed via vagina; uterus is separated from surrounding structures by vaginal route, no abdominal incisions
  - indications: mobile uterus, uterine size <12 wk
  - advantages: less pain, faster recovery time, allows for simultaneous repair of rectocele/cystocele/enterocele, improved aesthetics. This is the gold standard of the minimally invasive routes.
3. Robotic
  - similar advantages to laparoscopy
  - may be advantageous in high BMI patients
  - more costly

Table 1. Classification of Hysterectomy

<table>
<thead>
<tr>
<th>Classification</th>
<th>Tissues Removed</th>
<th>Indications</th>
</tr>
</thead>
</table>
| Subtotal Hysterectomy | Uterus | Inaccessible cervix (e.g. adhesions)  
Patient choice/preference  
Severe endometriosis |
| Total Hysterectomy (extrafascial simple hysterectomy/type 1) | Uterus, cervix, uterine artery ligated at uterus | Uterine fibroids  
Endometriosis  
Adenomyosis  
Menorrhagia  
DUB |
| Total Hysterectomy (extrafascial simple hysterectomy/type 1) + Bilateral Salpingo-Oophorectomy | Uterus, cervix, uterine artery ligated at uterus, fallopian tubes, ovaries | Endometrial cancer  
Malignant adrenal masses  
Consider for endometriosis |
| Modified Radical Hysterectomy (type 2) | Uterus, cervix, proximal 1/3 parametria, uterine artery ligated medial to the ureter, mid point of uterosacral ligaments and upper 1-2 cm vagina | Cervical cancer [up to stage IB1] |
| Radical Hysterectomy (type 3) | Uterus, cervix, upper 1/3-1/2 vagina, entire parametria, uterine artery ligated at its origin from internal iliac artery, uterosacral ligament at most distal attachment (rectum) | Cervical cancer |
Disorders of Menstruation

Disorders of Menstruation

- β-hCG, hormonal workup (TSH, prolactin, FSH, LH, androgens, estradiol)
- progesterone challenge to assess estrogen status
  - medroxyprogesterone acetate (Provera™) 10 mg PO OD for 10-14 d
  - any uterine bleed within 2-7 d after completion of Provera™ is considered to be a positive test/withdrawal bleed
    - withdrawal bleed suggests presence of adequate estrogen to thicken the endometrium; thus withdrawal of progesterone results in bleeding
    - if no bleeding occurs, there may be inadequate estrogen (hypoestrogenism), excessive androgens, or progesterones (decidualization)
- karyotype: indicated if premature ovarian failure or absent puberty
- U/S to confirm normal anatomy, identify PCOS

</table>

**Prolactinoma Symptoms**

- Galactorrhea, visual changes, headache

**Primary Amenorrhea**

- No menses by age 13 in absence of 2º sexual characteristics or no menses by age 15 with 2º sexual characteristics or no menses 2 yr after thelarche

**Secondary Amenorrhea**

- No menses for > 6 mo or 3 cycles after documented menarche

**Oligomenorrhea**

- Episodic vaginal bleeding occurring at intervals > 35 d

**2º amenorrhea is pregnancy until proven otherwise**

**Abnormal Uterine Bleeding**

- Regular (predictable cycle)
  - Heavy
    - AUB-A
    - AUB-LSM
    - AUB-C
    - AUB-E
  - Intermenstrual Bleeding
  - AUB-P

- Irregular (unpredictable cycle)
  - AUB and/or unpredictable AUB
    - AUB-O
    - AUB-M

Figure 11. Diagnostic approach to abnormal uterine bleeding
Approach
- is it regular?
  - regular: cycle to cycle variability of <20 d – “Can you predict your menses within 20 days?”
  - irregular: cycle to cycle variability of ≥20 d
- is it heavy
  - ≥80 cc of blood loss per cycle or
  - ≥8 d of bleeding per cycle or
  - bleeding that significantly affects quality of life
- is it structural?
  - PALM
- is it non-structural?
  - COEIN

</table>

*Ferrous gluconate 300 mg PO TID will raise Hb 10 points per wk

Treatment
- resuscitate patient if hemodynamically unstable
- treat underlying disorders
  - if anatomic lesions and systemic disease have been ruled out, consider AUB
- medical
  - mild AUB
    - NSAIDs
    - anti-fibrinolytic (e.g. Cyklokapron®) at time of menses
    - combined OCP
    - progestins (Provera®) on first 10-14 d of each month or every 3 mo if AUB-O
    - Mirena® IUD
    - danazol
  - acute, severe AUB
    - replace fluid losses, consider admission
      - a) estrogen (Premarin®) 25 mg IV q4h x 24 h with Gravol® 50 mg IV/PO q4h or anti-fibrinolytic (e.g. Cyklokapron®) 10 mg/kg IV q8h
      - b) Tapering OCP regimen, 35µg pill TID x7d then taper to 1 pill/d for 3w with Gravol® 50 mg IV/PO q4h
      - taper to 1 tab tid x 2 d → bid x 2 d → OD
      - after (a) or (b), maintain patient on monophasic OCP for next several months or consider alternative treatments

Abnormal Uterine Bleeding
Change in frequency, duration, or amount of menstrual flow

AUB in women >40 yr requires an endometrial biopsy to rule out cancer even if known to have fibroids

Determine if patient is hemodynamically stable prior to any other task
Endometriosis

- surgical
  - endometrial ablation
    - if finished childbearing
    - repeat procedure may be required if symptom reoccur especially if <40 yr
  - hysterectomy: definitive treatment

Dysmenorrhea

Etiology
- see Differential Diagnoses of Common Presentations, GY6

</tr>
<tr>
<td>Diagnosis</td>
<td>Associated dyspareunia, abnormal bleeding, infertility Rule out underlying pelvic patholgy and confirm cyclic nature of pain</td>
<td>Bimanual exam: uterine or adnexal tenderness, fixed uterine retroflexion, uterosacral nodularity, pelvic mass, or enlarged irregular uterus (findings are rare in women &lt;20 yr) U/S, laparoscopy and hysteroscopy may be necessary to establish the diagnosis Screening for infections (vaginal and cervical cultures) may be required</td>
</tr>
<tr>
<td>Treatment</td>
<td>PG synthetase inhibitors (e.g. Anaprox®): should be started before onset of pain OCP: suppress ovulation/reduce menstrual flow</td>
<td>Treat underlying cause</td>
</tr>
</tbody>
</table>

Endometriosis

Etiology
- not fully understood
- proposed mechanisms (combination likely involved)
  - retrograde menstruation (Sampson's theory)
  - immunologic theory: altered immunity may limit clearance of transplanted endometrial cells from pelvic cavity (may be due to decreased NK cell activity)
  - metaplasia of coelomic epithelium
  - extrapelvic disease may be due to aberrant vascular or lymphatic dissemination of cells
    - e.g. ovarian endometriosis may be due to direct lymphatic flow from uterus to ovaries

Epidemiology
- incidence: 15-30% of pre-menopausal women
- mean age at presentation: 25-30 yr
- regresses after menopause

Risk Factors
- family history (7-10x increased risk if affected 1st degree relative)
- obstructive anomalies of the genital tract (earlier onset) – resolve with treatment of anomaly
- nulliparity
- age >25 yr

Sites of Occurrence
- ovaries: 60% patients have ovarian involvement
- broad ligament, vesicoperitoneal fold
- peritoneal surface of the cul-de-sac, uterosacral ligaments
- rectosigmoid colon, appendix
- rarely may occur in sites outside abdomen/pelvis, including lungs

A sharp, firm, and exquisitely tender “barb” on the uterosacral ligament is a classic feature of endometriosis
Clinical Features

- may be asymptomatic and can occur with one of 3 presentations

1. pain
   - menstrual symptoms
   - cyclic symptoms due to growth and bleeding of ectopic endometrium, usually precede menses (24-48 h) and continue throughout and after flow
   - secondary dysmenorrhea
   - sacral backache with menses
   - pain may eventually become chronic, worsening perimenstrually
   - deep dyspareunia
   - bowel and bladder symptoms
   - frequency, dysuria, hematuria
   - cyclic diarrhea/constipation, hematochezia, dyschezia (suggestive of deeply infiltrating disease)

2. infertility
   - 30-40% of patients with endometriosis will be infertile
   - 15-30% of those who are infertile will have endometriosis

3. mass (endometrioma)
   - ovarian mass can present with any of above symptoms or be asymptomatic
   - physical
     - tender nodularity of uterine ligaments and cul-de-sac felt on rectovaginal exam
     - fixed retroversion of uterus
     - firm, fixed adnexal mass (endometrioma)
   - physical findings not present in adolescent population

Investigations

- definitive diagnosis requires
  - direct visualization of lesions typical of endometriosis at laparoscopy
  - biopsy and histologic exam of specimens (2 or more of: endometrial epithelium, glands, stroma, hemosiderin-laden macrophages)

- laparoscopy
  - mulberry spots: dark blue or brownish-black implants on the uterosacral ligaments, cul-de-sac, or anywhere in the pelvis
  - endometrioma: “chocolate” cysts on the ovaries
  - “powder-burn” lesions on the peritoneal surface
  - early white lesions and clear blebs
  - peritoneal “pockets”

- CA-125
  - may be elevated in patients with endometriosis but should NOT be used as a diagnostic test

Figure 12. SOGC guidelines for treatment of endometriosis

Treatment

- surgical confirmation of disease is NOT required prior to starting medical management.
- Asymptomatic endometriosis does not require treatment. Management depends on certainty of the diagnosis, severity of symptoms, extent of disease, desire for future fertility, and impact to GI/GU systems (e.g. intestinal obstruction)

- medical
  - NSAIDs (e.g. naproxen sodium – Anaprox®)
  - 1st line
    - cyclic/continuous estrogen-progestin (OCP)
    - progestin (IM medroxyprogesterone (Depo-Provera®) or oral dienogest (Visanne®)
    - Mirena® IUS

Endometriosis – Take Home Points

- Suggestive history even with a negative exam should be considered adequate for a presumptive diagnosis
- Pelvic pain that is not primary dysmenorrhea should be considered endometriosis until proven otherwise
- Medical management is the mainstay of endometriosis
Adenomyosis

• synonym: “endometriosis interna” (uterine wall may be diffusely involved)

Epidemiology
• 15% of females >35 yr old; found in 20-40% of hysterectomy specimens
• mean age at presentation: 40-50 yr old (older age group than seen in endometriosis)
• adenomyosis is a common histologic finding in asymptomatic patients

Clinical Features
• often asymptomatic
• menorrhagia, secondary dysmenorrhea, pelvic discomfort
• dyspareunia, dyschezia
• uterus symmetrically bulky, usually <14 cm, mobility not restricted, no associated adnexal pathology
• Halban sign: tender, softened uterus on premenstrual bimanual exam

Investigations
• clinical diagnosis
• U/S or MRI can be helpful
• endometrial sampling to rule out other pathology

Treatment
• iron supplements as necessary
• analgesics, NSAIDs
• OCP, medroxyprogesterone (Depo-Provera™)
• GnRH agonists (e.g. leuprolide)
• Mirena™ IUS
• low dose danazol 100-200 mg PO OD (trial x 4 mo)
• definitive: hysterectomy (no conservative surgical treatment)

Fibroids

Epidemiology
• diagnosed in approximately 40-50% of pre-menopausal women >35 yr
• more common in African Americans, where they are also larger and occur at earlier age
• common indication for major surgery in females
• minimal malignant potential (1:1,000)
• typically regress after menopause; enlarging fibroids in a postmenopausal woman should prompt consideration of malignancy

Pathogenesis
• estrogen stimulates monoclonal smooth muscle proliferation
• progestrone stimulates production of proteins that inhibit apoptosis
• degenerative changes (occur when tumour outgrows blood supply)
• fibroids can degenerate, become calcified, have sarcomatous component or obtain parasitic blood supply

Clinical Features
• majority asymptomatic (60%), often discovered as incidental finding on pelvic exam or U/S
• abnormal uterine bleeding (30%): dysmenorrhea, menorrhagia
• pressure/bulk symptoms (20-50%)
  • pelvic pressure/heaviness
  • increased abdominal girth
  • urinary frequency and urgency
  • acute urinary retention (extremely rare but surgical emergency?)
  • constipation, bloating (rare)
• acute pelvic pain
  ■ fibroid degeneration
  ■ fibroid torsion (pedunculated subserosal)
• infertility, recurrent pregnancy loss
• pregnancy complications (potential enlargement and increased pain, obstructed labour, difficult C-section)

Investigations
• bimanual exam: uterus asymmetrically enlarged, usually mobile
• CBC: anemia
• U/S: to confirm diagnosis and assess location of fibroids
• sonohysterogram: useful for differentiating endometrial polyps from submucosal fibroids, or if intracavitary growth
• endometrial biopsy to rule out uterine cancer (especially if age >40 yr)
• occasionally MRI is used for pre-operative planning (e.g. before myomectomy)

Treatment
• only if symptomatic, rapidly enlarging, menorrhagia, menometrorrhagia, or intracavitary
• treat anemia if present
• conservative approach (watch and wait) if
  ■ symptoms absent or minimal
  ■ fibroids <6-8 cm or stable in size
  ■ not submucosal (submucosal fibroids are more likely to be symptomatic)
  ■ currently pregnant due to increased risk of bleeding (follow-up U/S if symptoms progress)
• medical approach to treat AUB-L
  ■ antiprostaglandins (ibuprofen, other NSAIDs)
  ■ tranexamic acid (Cyklokapron®)
  ■ GnRH agonist: leuprolide (Lupron®), danazol (Danocrine®)
    ■ short-term use only (6 mo)
    ■ often used pre-myomectomy or pre-hysterectomy to reduce fibroid size
    ■ reduced bleeding
  ■ ulipristal acetate: a partial progesterone receptor agonist
• interventional radiology approach
  ■ uterine artery embolization (occludes both uterine arteries) → shrinks fibroids by 50% at 6 mo; improves heavy bleeding in 90% of patients within 1-2 mo; not an option in women considering childbearing
• surgical approach
  ■ myomectomy (hysteroscopic, transabdominal, or laparoscopic): preserves fertility
  ■ hysteroscopic resection of fibroid and endometrial ablation for AUB-Lsm
  ■ hysterectomy (see Hysterectomy, GY9)
  ■ note: avoid operating on fibroids during pregnancy (due to vessel activity and potential pregnancy loss); expectant management usually best

Contraception

see Family Medicine, FM19

---

The effect of pregnancy on fibroid size is variable

Submucosal leiomyomata are most symptomatic (bleeding, infertility)

Ulipristal Acetate vs. Leuprolide Acetate for Uterine Fibroids

NEJM 2012;366:421-432

Study: Phase II, double-blind RCT of the efficacy and side-effect profile of ulipristal acetate versus those of leuprolide acetate for the treatment of symptomatic uterine fibroids before surgery.

Outcomes: Control of uterine bleeding at week 13 was the primary outcome. Secondary outcomes included bleeding pattern, amenorrhea, changes in fibroid/uterine volume, and global pain score.

Patients: 307 premenopausal women with symptomatic fibroids and excessive uterine bleeding were randomly assigned to oral ulipristal acetate (5 mg or 10 mg) or intramuscular injections of leuprolide acetate.

Results: Control of bleeding at week 13 was not significantly different between the treatment groups. All three treatments reduced uterine volume, although this decrease was significantly greater in the leuprolide group (47% reduction) than in the ulipristal groups (30-22%). 40% of the leuprolide group reported moderate-to-severe hot flashes, but only 11% (5 mg) and 10% (10 mg) of the ulipristal groups did.

Conclusions: Oral ulipristal acetate (5 mg or 10 mg) is noninferior to intramuscular leuprolide acetate for control of uterine bleeding due to fibroids, and it had a better side-effect profile.

Counselling the Adolescent about Contraception

More than 90% of adolescent pregnancies are unintended, and ~50% of all pregnancies occur within the first 6 mo of initiating sexual activity; in addition, 85% of sexually active women become pregnant within 1 yr if no contraception is used and even some of the least effective contraceptive methods markedly decrease the risk of pregnancy.

Effectiveness: percentage of women reporting no pregnancy after 1 yr of use

**Hormonal Methods**

**Combined Oral Contraceptive Pills**
- most contain low dose ethinyl estradiol (20-35 µg) plus progestin (norethindrone, norgestrel, levonorgestrel, desogestrel, norgestimate, drospirenone)
- failure rate (0.3% to 8%) depending on compliance
- monophasic or triphasic formulations (varying amount of progestin throughout cycle)

**Transdermal (Ortho Evra®)**
- continuous release of 6 mg norgestimate and 0.60 mg ethinyl estradiol into bloodstream
- applied to lower abdomen, back, upper arm, buttocks, NOT breast
- worn for 3 consecutive weeks (changed every wk) with 1 wk off to allow for menstruation
- as effective as OCP in preventing pregnancy (>99% with perfect use)
- may be less effective in women >90 kg
- may not be covered by drug plans

**Contraceptive Ring (Nuva Ring®)**
- thin flexible plastic ring; releases etonogestrel 120 µg/d and estradiol 15 µg/d
- works for 3 wk then removed for 1 wk to allow for menstruation
- as effective as OCP in preventing pregnancy (98%)
- side effects: vaginal infections/irritation, vaginal discharge
- may have better cycle control; i.e. decreased breakthrough bleeding

**Starting Hormonal Contraceptives**
- thorough history and physical exam, including blood pressure and breast exam
- can start at any time during cycle but ideal if within 5 d of LMP
- follow-up visit 6 wk after hormonal contraceptives prescribed
- pelvic exam not required as STI screening can be done by urine and pap smear screening does not start until >21 yr

**Effect of Ethinyl Estradiol Dose**
- ALL OCPs with ≤35 µg ethinyl estradiol carry a lower risk of VTE compared with oral contraceptives with ≥50 µg.

**Effect of Progestin Type**
- Drospirenone: third generation progestin, e.g. Tesirone and Femulen®
- Levonorgestrel: first generation progestin, e.g. Alesse®
- Two high quality research studies found comparable VTE rates with drospirenone-containing OCPs and other approved products.

**Results**
- Total of 1,686,158 women, thrombotic VTE rates with drospirenone-containing OCPs and other approved products.
- Two reports with significant methodological flaws found increased VTE risk. Results and conclusions may have been distorted by residual confounding.
- Lidegaard et al., NEJM 2009;339:b2921
- Seeger et al., Obstet Gynecol 2007;110:587-593
- One quality research study found the VTE rates with drospirenone-containing OCPs and other approved products.
- Dinger et al., Contraception 2007;75:344-354
- VTE rates with drospirenone-containing OCPs and other approved products.

**Conclusion**
- Occurrence of serious risks, such as VTE, is rare with all contemporary OCPs.
- Individualized risk assessment is mandatory.
- For most healthy women of reproductive age, the benefits of OCP will outweigh the risks.

**Oral Contraceptives and the Risk of Venous Thromboembolism: An Update (2010)**
- Rates of Venous Thromboembolism (VTE: DVT and PE) expressed in per year.
- Hormones of reproductive age: 4-5/10,000
- OCP users: 9-10/10,000
- Pregnancy: 29/10,000
- Immediate post-partum: 300-400/10,000
- Risk is highest in the first months of use and in medication switch and if stop and restart.

**Conclusions**
- Although the absolute risk of thrombotic stroke and MI with hormonal contraception is low, it is increased by a factor of 0.9-1.7 with oral contraceptives that contain ethinyl estradiol at a dose of 20 µg and by a factor of 1.2-2.3 with ethinyl estradiol doses of 30-40 µg, with relatively small differences in risk according to progestin type.

Reference: World Health Organization Guidelines for Oral Contraceptive Pill Use
SELECTED EXAMPLES OF PROGESTIN-ONLY METHODS

Progestin-Only Pill ("minipill")
- Micronor® 0.35 mg norethindrone
- taken daily at same time of day to ensure reliable effect; no pill free interval
- higher failure rate (1.1-13% with typical use, 0.5-1% with perfect use) than other hormonal methods
- ovulation inhibited only in 60% of women; most have regular cycles (but may cause oligo/amenorrhea)
- highly effective if also post-partum breastfeeding, or if >35 yr
- relies on the progestin effects on the cervical mucous and endometrial lining

Depo-Provera®
- injectable depot medroxyprogesterone acetate
- dose 150 mg IM q12-14wk (convenient dosing)
- initiate ideally within 5 d of beginning of normal menses, immediately postpartum in breastfeeding and non-breastfeeding women. Can consider quick start
- irregular spotting progresses to complete amenorrhea in 70% of women (after 1-2 yr of use)
- highly effective 99%; failure rate 0.3%
- suppresses ovulation very effectively
- side effect: decreased bone density (may be reversible)
- disadvantage: restoration of fertility may take up to 1-2 yr

*Cervical swabs for gonorrhea and chlamydia should be done prior to insertion

</tbody>
</table>

Follow-up
- 3–4 wk post treatment to confirm efficacy (confirmed by spontaneous menses or pregnancy test)
- contraception counselling

Termination of Pregnancy

Definition
- active termination of a pregnancy before fetal viability (usually <500 g or <20 wk GA)

Indications
- inability to carry a pregnancy to term due to medical or social reasons (including patient preference)

Management
- medical
  - <9 wk: methotrexate + misoprostol
  - >12 wk: prostaglandins (intra- or extra-amniotically or IM) or misoprostol
- surgical
  - <12 wk: dilatation + vacuum aspiration ± curettage
  - >12 wk: dilatation and evacuation, early induction of labour
  - common complications: pain or discomfort
  - less common complications: hemorrhage, perforation of uterus, laceration of cervix, risk of infertility, infection/endometritis, Asherman’s syndrome (adhesions within the endometrial cavity causing amenorrhea/infertility), retained products of conception
- counselling
  - supportive and counselling services
  - future contraception and family planning services
  - ensure follow-up

Any OCP can be used as EPC; 100 µg ethinyl estradiol PO q12h x 2 doses
- Levonorgestrel emergency contraception regimens are more effective and cause fewer side effects than the Yuzpe regimen
- Levonorgestrel emergency contraception single dose (1.5 mg) and the 2-dose levonorgestrel regimen (0.75 mg 12 h apart) have similar efficacy with no difference in side effects

CMA Policy (1988)
- “Induced abortion should be uniformly available to all women in Canada” and “there should be no delay in the provision of abortion services”

Terminations are generally done until the stage of viability (~23.5 wk), although this varies depending on the provider
Pregnancy-Related Complications

Spontaneous Abortions

- see Termination of Pregnancy for therapeutic abortions

Table 13. Classification of Spontaneous Abortions

<table>

| Septic        | Contents of uterus infected – infrequent |                           | DB & IV broad spectrum antibiotics    |

Ectopic Pregnancy

Definition
- embryo implants outside of the endometrial cavity

Figure 14. Sites of ectopic pregnancy implantation

- Ampullary (70%) >> isthmal (12%) > fimbrial (11%) > ovarian (3%) > interstitial (2%) > abdominal (1%)

Epidemiology
- 1/100 pregnancies
- fourth leading cause of maternal mortality, leading cause of death in first trimester
- increase in incidence over the last 3 decades
- three commonest locations for ectopic pregnancy: ampullary (70%), isthmic (12%), fimbrial (11%)
Ectopic Pregnancy

**Etiology**
- 50% due to damage of fallopian tube cilia following PID
- intrinsic abnormality of the fertilized ovum
- conception late in cycle
- transmigration of fertilized ovum to contralateral tube

**Risk Factors**
- previous ectopic pregnancy
- gynecologic
  - current IUD use – increased risk of ectopic if pregnancy occurs
  - history of PID (especially infection with *C. trachomatis*), salpingitis
  - infertility
  - infertility treatment (IVF pregnancies following ovulation induction [7% ectopic rate])
  - previous procedures
    - any surgery on fallopian tube (for previous ectopic, tubal ligation, etc.)
    - abdominal surgery for ruptured appendix, etc.
  - smoking
  - structural
    - uterine leiomyomas
    - adhesions
    - abnormal uterine anatomy (e.g. T-shaped uterus)

**Investigations**
- serial β-hCG levels; normal doubling time with intrauterine pregnancy is 1.6-2.4 d in early pregnancy
  - rise of <20% of β-hCG is 100% predictive of a non-viable pregnancy
  - prolonged doubling time, plateau, or decreasing levels before 8 wk implies nonviable gestation but does not provide information on location of implantation
  - 85% of ectopic pregnancies demonstrate abnormal β-hCG doubling
- ultrasound
  - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
  - specific finding on transvaginal U/S is a tubal ring
  - suspect ectopic in case of empty uterus with β-hCG >5000 and no bleeding
  - laparoscopy (sometimes used for definitive diagnosis)

**Treatment**
- goals of treatment: conservative (preserve tube if possible), maintain hemodynamic stability
- surgical = laparoscopy
  - linear salpingostomy an option if tube salvageable
  - salpingectomy if tube damaged or ectopic is ipsilateral recurrence
  - 15% risk of persistent trophoblast; must monitor β-hCG titre weekly until they reach non-detectable levels
  - consider Rhogam® if Rh negative
  - may require laparotomy if patient is unstable, extensive abdominal surgical history, etc.

---

**DDx of Lower Abdominal Pain**
- Urinary tract: UTI, kidney stones
- GI: diverticulitis, appendicitis
- Gyne: endometriosis, PID, fibroid (degenerating, infarcted, torsion), ovarian torsion, ovarian neoplasm, ovarian cyst, pregnancy-related

**Clinical Features of Ectopic Pregnancy**
- 4Ts and 1S
  - Temperature >38°C (20%)
  - Tenderness: abdominal (90%) = rebound (45%)
  - Tenderness on bimanual examination, cervical motion tenderness
  - Tissue: palpable adnexal mass (50%) (half have contralateral mass due to lutein cyst)
  - Signs of pregnancy (e.g. Chadwick’s sign, Hegar’s sign)

**Figure 15. Algorithm for suspected ectopic pregnancy**

**Suspected Ectopic Pregnancy**
1. Positive urine β-hCG
2. Abdominal pain
3. Vaginal bleeding

**Procedures**
- Vital signs stable
  - Transvaginal U/S
  - Serum β-hCG
- Vital signs unstable
  - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
  - Methotrexate
  - Consider surgical management; if using methotrexate, follow-up is more frequent

**If Ectopic Pregnancy Ruptures**
- Acute abdomen with increasing pain
- Shock
- Management of Abortions
  - Always rule out an ectopic
  - Always check Rh; if negative, give Rhogam®
  - Always ensure patient is hemodynamically stable
• medical = methotrexate (for indications see Figure 4)
  ■ use 50 mg/m² body surface area; given in a single IM dose
  ■ this is 1/5 to 1/6 chemotherapy dose, therefore minimal side effects (reversible hepatic dysfunction, diarrhea, gastritis, dermatitis)
  ■ follow β-hCG levels weekly until β-hCG is non-detectable
    • plateau or rising levels suggest persisting trophoblastic tissue (requires further treatment)
  ■ 82-95% success rate, but up to 25% will require a second dose
  ■ tubal patency following methotrexate treatment approaches 80%

Prognosis
• 9% of maternal deaths during pregnancy
• 40-60% of patients will become pregnant again after surgery
• 10-20% will have subsequent ectopic pregnancy

Infertility

Epidemiology
• 10-15% of couples, must investigate both members of the couple

Female Factors

Etiology
• ovulatory dysfunction (15-20%)
  ■ hypothalamic (hypothalamic amenorrhea)
    • stress, poor nutrition, excessive exercise (even with presence of menstruation)
  ■ pituitary (prolactinoma, hypopituitarism)
  ■ PCOS
  ■ ovarian
    • premature ovarian failure
    • luteal phase defect (poor follicle production, premature corpus luteum failure, failed uterine lining response to progesterone), poorly understood
  ■ systemic diseases (thyroid, Cushing’s syndrome, renal/hepatic failure)
    • congenital (Turner’s syndrome, gonadal dysgenesis or gonadotropin deficiency)
  ■ outflow tract abnormality (15-20%)
    • tubal factors (20-30%)
      • PID
      • adhesions (previous surgery, peritonitis, endometriosis)
      • ligation/occlusion (e.g. previous ectopic pregnancy)
    • uterine factors (<5%)
      • congenital anomalies, bicornuate uterus, septate uterus, prenatal DES exposure, intrauterine adhesions (e.g. Asherman’s syndrome), fibroids/polyps (particularly intrauterine)
      • infection (endometritis, pelvic TB)
      • endometrial ablation
    • cervical factors (5%)
      • hostile or acidic cervical mucus, anti-sperm antibodies
      • structural defects (cone biopsies, laser or cryotherapy)
  ■ endometriosis (15-30%)
  ■ multiple factors (30%)
  ■ unknown factors (10-15%)

Investigations
• ovulatory
  ■ day 3: FSH, LH, TSH, prolactin ± DHEA, free testosterone (if hirsute) add estradiol for proper FSH interpretation
  ■ day 21-23: serum progesterone to confirm ovulation
  ■ initiate basal body temperature monitoring (biphasic pattern)
  ■ postcoital test: evaluate mucus for clarity, pH, spininbarkeit/fibrosity (rarely done)
• tubal factors
  • HSG (can be therapeutic – opens fallopian tube)
  • SHG (can be therapeutic; likely less – opens fallopian tube)
  • laparoscopy with dye insufflation (or tubal dye test)
• peritoneal/uterine factors
  • HSG/SHG, hysteroscopy
  • other
    • karyotype

Controversial and Evolving Ethical Issues
• infertility demands non-judgmental discussion
• Ethical issues surrounding therapeutic donor insemination in same sex couples, surrogacy, donor gametes, and other advanced reproductive technologies are still evolving and remain controversial
• If the doctor finds that certain treatment options lie outside of their moral boundaries, the infertile couple should be referred to another physician

Interventions for Tubal Ectopic Pregnancy
Cochrane Review of randomized controlled trials comparing treatments in women with tubal ectopic pregnancy.

Patients: Women with a diagnosis of tubal ectopic pregnancy.

Intervention: Surgery (salpingectomy/ salpingostomy by open surgery or by laparoscopy), medical treatment, and expectant management.

Main Outcome: Primary treatment success, defined as an uneventful decline in serum β-hCG to undetectable levels by the initial treatment.

Results: Intramuscular MTX therapy and salpingostomy yielded similar treatment success rates (82-95% for MTX therapy vs. 80-92% for salpingostomy).
Polycystic Ovarian Syndrome

**Treatment**
- education: timing intercourse relative to ovulation (from 2 d prior to 2 d following presumed ovulation), every other day
- medical
  - ovulation induction
    - clomiphene citrate (Clomid\(^\text{TM}\)): estrogen antagonist causing a perceived decreased estrogen state, resulting in increased pituitary gonadotropins; which increases FSH and LH and induces ovulation (better results if anovulatory)
    - followed by β-hCG for stimulation of ovum release
  - may add
    - bromocriptine (dopamine agonist) if elevated prolactin
    - dexamethasone for hyperandrogenism (adult onset congenital adrenal hyperplasia)
    - metformin (for PCOS)
  - luteal phase progesterone supplementation for luteal phase defect (mechanism not completely understood)
  - antigestagen and ASA (81 mg PO OD) for women with a history of recurrent spontaneous abortions (for antiphospholipid antibody syndrome)
  - thyroid replacement to keep TSH < 2.5
- surgical/procedural
  - tubuloplasty
  - lysis of adhesions
  - artificial insemination: intracervical insemination (ICI), intrauterine insemination (IUI), intratubal insemination (ITI)
  - sperm washing
  - IVF (in vitro fertilization)
  - IFT (intrafallopian transfer)
  - GIFT\(^*\) (gamete intrafallopian transfer): immediate transfer with sperm after oocyte retrieval
  - ZIFT\(^*\) (zygote intrafallopian transfer): transfer after 24 h culture of oocyte and sperm
  - TET\(^*\) (tubal embryo transfer): transfer after >24 h culture
  - ICSI (intracytoplasmic sperm injection)
  - IVM (in vitro maturation)
  - ± oocyte or sperm donors
  - ± pre-genetic screening for single gene defects in karyotype of zygote
  - not performed in Canada

**Male Factors**

- see Urology, U34

**Etiology**
- varicocele (>40%)
- idiopathic (>20%)
- obstruction (<15%)
- cryptorchidism (<8%)
- immunologic (<3%)

**Investigations**
- semen analysis and culture
- postcoital (Hühner) test: rarely done

**Polycystic Ovarian Syndrome**

- also called chronic ovarian androgenism

**Etiology**

![Pathophysiology of polycystic ovarian syndrome]

- Obesity
- ↑ peripheral conversion to estrogen
- ↑ estrogen
- ↓ FSH secretion + ↑ LH secretion
- Anovulation
- ↑ ovarian secretion of androgens
- Hirsutism
- Infertility
- Oligomenorrhea
- Insulin
- ↑ peripheral conversion to estrogen
- ↑ estrogen
Diagnosis
- Rotterdam diagnostic criteria: 2 of 3 required
  - oligoamenorrhea/irregular menses for 6 mo
  - hyperandrogenism
    - clinical evidence - hirsutism or male pattern alopecia or
    - biochemical evidence - raised free testosterone
  - polycystic ovaries on U/S

Clinical Features
- average age 15-35 yr at presentation
- in adolescents, wait at least 1-2 yr to make diagnosis
- abnormal/irregular uterine bleeding, hirsutism, infertility, obesity, virilization
- anacistic nigrians: browning of skin folds in intertriginous zones (indicative of insulin resistance)
- insulin resistance occurs in both lean and obese patients, family history of DM

Investigations
- goal: identify hyperandrogenism or chronic anovulation; and rule out specific pituitary or adrenal disease as the cause
- laboratory
  - prolactin, 17-hydroxyprogesterone, free testosterone, DHEA-S, TSH, free T4, androstenedione, SHBG
  - LH:FSH >2:1; LH is chronically high with FSH mid-range or low (low sensitivity and specificity)
  - increased DHEA-S, androstenedione and free testosterone (most sensitive), decreased SHBG
- transvaginal or transabdominal U/S: polycystic-appearing ovaries (“string of pearls” – 12 or more small follicles 2-9 mm, or increased ovarian volume)
- tests for insulin resistance or glucose tolerance
  - fasting glucose/insulin ratio <4.5 is consistent with insulin resistance (U.S. units)
  - 75 g OGTT yearly (particularly if obese)
- laparoscopy
  - not required for diagnosis
  - most common to see white, smooth, sclerotic ovaries with a thick capsule; multiple follicular cysts in various stages of atresia; hyperplastic theca and stroma
- rule out other causes of abnormal bleeding

Treatment
- lifestyle modification (decrease BMI, increase exercise) to decrease peripheral estrone formation
- OCP monthly or cyclic Provera® to prevent endometrial hyperplasia due to unopposed estrogen
- oral hypoglycemic (e.g. metformin) if type 2 diabetic or if trying to become pregnant
- tranexamic acid (Cyklokapron®) for menorrhagia only
- infertility
  - medical induction of ovulation: clomiphene citrate, human menopausal gonadotropins (HMG [Pergonal®]), LHHR, recombinant FSH, and metformin
  - metformin may be used alone or in conjunction with clomiphene citrate for ovulation induction
  - ovarian drilling (perforate the stroma), wedge resection of the ovary
- bromocriptine (if hyperprolactinemia)
- hyperandrogenism
  - any OCP can be used
    - Diane 35® (cyproterone acetate): antiandrogenic
    - Yasmin® (drospirenone and ethinyl estradiol): spironolactone analogue (inhibits steroid receptors)
  - mechanical removal of hair
  - finasteride (3-a reductase inhibitor)
  - flutamide (androgen reuptake inhibitor)
  - spironolactone: androgen receptor inhibitor

Use of Metformin in Polycystic Ovary Syndrome: A Meta-Analysis
Study: This meta-analysis of 17 RCTs assessed the efficacy of metformin or metformin in combination with clomiphene citrate in women with PCOS who were seeking pregnancy.
Main Outcomes: Ovulation, pregnancy, and live birth. Patients: 1,639 patients with PCOS were followed up for up to 12 mo.
Results: Compared to placebo, metformin increased the odds of ovulation (OR 2.94, 95% CI 1.43-6.02). However, when used alone, metformin did not significantly increase the odds of achieving pregnancy (OR 1.56, 95% CI 0.74-3.33). When compared to clomiphene alone, the combination of metformine and clomiphene increased the likelihood of ovulation (OR 4.39, 95% CI 1.94-9.96) and pregnancy (OR 2.87, 95% CI 1.45-4.94). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS. Furthermore, the combination therapy had a higher likelihood of having a live birth compared to clomiphene alone, but this did not reach significance (OR 1.7, 95% CI 0.79-3.86).
Conclusions: Metformin increases the likelihood of ovulation. When used together with clomiphene, metformin increases the likelihood of both ovulation and pregnancy, especially in clomiphene-resistant and obese women.

Gynecological Infections
Physiologic Discharge
- clear, white, flocculent, odourless discharge; pH 3.8-4.2
- smear contains epithelial cells, Lactobacilli
- increases with increased estrogen states: pregnancy, OCP mid-cycle, PCOS, or premenarchal
- if increased in perimenopausal/postmenopausal woman, consider investigation for other effects of excess estrogen (e.g. endometrial cancer)
**Vulvovaginitis**

**PREPUBERTAL VULVOVAGINITIS**

- **clinical features**
  - irritation, pruritus
  - discharge
  - vulvar erythema
  - vaginal bleeding (specifically due to Group A Streptococci and *Shigella*).

- **differential diagnosis**
  - non-specific vulvovaginitis (25-75%)
  - infections (respiratory, enteric, systemic, sexually acquired)
  - foreign body (toilet paper most common)
  - *Candida* (if using diapers or chronic antibiotics)
  - pinworms
  - polyps, tumour (ovarian malignancy)
  - vulvar skin disease (*lichen sclerosis, condyloma acuminata*)
  - trauma (accidental straddle injury, sexual abuse)
  - psychosomatic vaginal complaints (specific to vaginal discharge)
  - endocrine abnormalities (specific to vaginal bleeding)
  - blood dyscrasia (specific to vaginal bleeding).

- **etiology**
  - infectious
    - poor hygiene, proximity of vagina to anus
    - recent infection (respiratory, enteric, systemic)
    - STI: investigate sexual abuse
  - non-specific
    - lack of protective hair and labial fat pads
    - lack of estrogenization
    - susceptible to chemicals, soaps (bubble baths), medications, and clothing
    - enuresis

- **investigations**
  - vaginal swab for culture (specifically state that it is a pre-pubertal specimen), pH, wet-mount, and KOH smear in adults only.

- **treatment**
  - enhanced hygiene and local measures (handwashing, white cotton underwear, no nylon tights, no tight fitting clothes, no sleeper pajamas, sitz baths, avoid bubble baths, use mild detergent, eliminate fabric softener, avoid prolonged exposure to wet bathing suits, urination with legs spread apart)
  - A&D® dermatological ointment (vitamin A/D) to protect vulvar skin
  - infectious: treat with antibiotics for organism identified

<td>Treatment</td>
<td>Empirical treatment with mebendazole</td>
<td>Area of white patches and thinning of skin</td>
<td>Irrigation of vagina with saline, may require local anesthesia or an exam under anesthesia</td>
</tr>
</tbody>
</table>

**VAGINITISROPHIC / VAGINITIS**

- **clinical features**
  - dyspareunia, postcoital spotting, mild pruritus

- **investigations**
  - atrophy is usually a visual diagnosis: thinning of tissues, erythema, petechiae, bleeding points, dryness on speculum exam
  - rule out malignancy, especially endometrial cancer

- **treatment**
  - local estrogen replacement (ideal): Premarin® cream, VagiFem® tablets, or Estring®
  - oral or transdermal hormone replacement therapy (if treatment for systemic symptoms is desired)
  - good hygiene

#### Other

- **Discharge**
  - Whitish, “cottage cheese,” minimal
  - Grey, thin, diffuse
  - Yellow-green, malodorous, diffuse, frothy
- **Other**
  - 20% asymptomatic
  - 50-75% asymptomatic
  - 25% asymptomatic
- **Signs/Symptoms**
  - Intense pruritus
  - Swollen, inflamed genitals
  - Vulvar burning, dysuria, dyspareunia
  - Fishy odour, especially after coitus
  - Absence of vulvar/vaginal irritation
  - Petechiae on vagina and cervix
  - Occasionally irritated tender vulva
  - Dysuria, frequency
- **pH**
  - ≤4.5
  - ≥4.5
- **Saline Wetmount**
  - KOH wetmount reveals hyphae and spores
  - >20% clue cells = squamous epithelial cells dotted with coccobacilli (Gardnerella)
  - Paucity of WBC
  - Paucity of Lactobacilli
  - Positive whiff test: fishy odour with addition of KOH to slide (due to formation of amines)

#### Treatment

- **Clotrimazole**, butoconazole, miconazole, terconazole suppositories, and/or creams for 1, 3, or 7 d treatments
- **Metronidazole 150 mg PO in single dose (can be used in pregnancy)**
- **Clindamycin 2% 5 g intravaginally at bedtime for 7 d**
- **Fluconazole 150 mg PO in single dose**
- **Lactobacillus**
- **Probiotics (lactobacillus sp.): oral or topical  alone or in combination**
- **Fluconazole 200 mg PO once**
- **Symptomatic pregnant women should be treated with 2 g metronidazole once**

#### Other

- **Prophylaxis for recurrent infection includes**
  - Boric acid, vaginal suppositories, luteal phase
  - Metronidazole
  - Fluconazole
  - Clindamycin
  - Flunisolide
  - Probiotics (lactobacillus sp.): oral or topical alone or as adjuvant
  - **Inflammation of cervix**

** warnings accompanying metronidazole use**

Treat even if asymptomatic

- **Metronidazole 2 g PO single dose or 500 mg bid x 7 d (alternative)**
- **Symptomatic pregnant women should be treated with 2 g metronidazole once**

---

**CDC Notifiable Diseases**

- Chancroid
- Chlamydia
- Gonorrhea
- Hepatitis A, B, C
- HIV
- Syphilis

**Risk Factors for STIs**

- History of previous STI
- Contact with infected person
- Sexually active individual <25 yr
- Multiple partners
- New partner in last 3 mo
- Lack of barrier protection use
- Street involvement (homelessness, drug use)

---

**Sexually Transmitted Infections**

- see Family Medicine, FM42
TRICHOMONIASIS
• see Infectious Vulvovaginitis, Table 15

CHLAMYDIA

Etiology
• Chlamydia trachomatis

Epidemiology
• most common bacterial STI in Canada
• often associated with N. gonorrhoeae

Clinical Features
• asymptomatic (80% of women)
• muco-purulent endocervical discharge
• urethral syndrome: dysuria, frequency, pyuria, no bacteria on culture
• pelvic pain
• postcoital bleeding or intermenstrual bleeding (particularly if on OCP and prior history of good cycle control)
• symptomatic sexual partner

Investigations
• cervical culture or nucleic acid amplification test
• obligate intracellular parasite: tissue culture is the definitive standard
• urine and self vaginal tests now available, which are equally or more effective than cervical culture

Treatment
• doxycycline 100 mg PO bid for 7 d or azithromycin 1 g PO in a single dose (may use in pregnancy)
• also treat gonorrhea because of high rate of co-infection
• treat partners
• reportable disease
• test of cure for chlamydia required in pregnancy (cure rates lower in pregnant patients) → retest 3-4 wk after initiation of therapy

Screening
• high risk groups
• during pregnancy
• when initiating OCP if sexually active (independent risk factor)

Complications
• acute salpingitis, PID
• Fitz-Hugh-Curtis syndrome (liver capsule inflammation)
• reactive arthritis (male predominance, HLA-B27 associated), conjunctivitis, urethritis
• infertility: tubal obstruction from low grade salpingitis
• ectopic pregnancy
• chronic pelvic pain
• perinatal infection: conjunctivitis, pneumonia

Etiology
• Neisseria gonorrhoeae
• symptoms and risk factors same as with chlamydia

Investigations
• Gram stain shows Gram-negative intracellular diplococci
• cervical, rectal, and throat culture (if clinically indicated)

Treatment
• single dose of ceftriaxone 250 mg IM plus azithromycin 1 g PO
  • if pregnant: above regimen or 2 g spectinomycin IM plus azithromycin 1 g PO (avoid quinolones)
  • also treat chlamydia, because of high rate of co-infection
• treat partners
  • reportable disease
  • screening as with chlamydia
HUMAN PAPILLOMAVIRUS

Etiology
- most common viral STI in Canada
- >200 subtypes, of which >30 are genital subtypes
- HPV types 6 and 11 are classically associated with anogenital warts/condylomata acuminata
- HPV types 16 and 18 are the most oncogenic (classically associated with cervical HSIL)
- types 16, 18, 31, 33, 35, 36, 45 (and others) associated with increased incidence of cervical and vulvar intraepithelial hyperplasia and carcinoma

Clinical Features
- latent infection
  - no visible lesions, asymptomatic
- subclinical infection
  - only detected by DNA hybridization tests
- clinical infection
  - visible lesion found during colposcopy or on Pap test
- visible wart-like lesion without magnification
  - hyperkeratotic, verrucous or flat, macular lesions
- vulvar edema

Investigations
- cytology
- koilocytosis: nuclear enlargement and atypia with perinuclear halo
- biopsy of lesions at colposcopy
- detection of HPV DNA subtype using nucleic acid probes (not routinely done but can be done in presence of abnormal Pap test to guide treatment)

Treatment
- patient administered
  - podofilox 0.5% solution or gel bid x 3 d in a row (4 d off) then repeat x 4 wk
  - imiquimod (Aldara*) 5% cream 3x/wk qhs x 16 wk
- provider administered
  - cryotherapy with liquid nitrogen: repeat q1-2wk
  - podophyllin resin in tincture of benzoin: weekly
  - trichloroacetic acid (TCA) or bichloroacetic acid weekly (80-90%); safe in pregnancy
  - surgical removal/laser
  - intralesional interferon

Prevention
- vaccination: Gardasil*, Cervarix* see Table 25, GY43
- condoms may not fully protect (areas not covered, must be used every time throughout entire sexual act)

HERPES SIMPLEX VIRUS OF VULVA

Etiology
- 90% are HSV-2, 10% are HSV-1

Clinical Features
- may be asymptomatic
- initial symptoms: present 2-21 d after contact
- prodromal symptoms: tingling, burning, pruritus
- multiple, painful, shallow ulcerations with small vesicles appear 7-10 d after initial infection (absent in many infected persons); lesions are infectious
- inguinal lymphadenopathy, malaise, and fever often with first infection
- dysuria and urinary retention if urethral mucosa affected
- recurrent infections: less severe, less frequent, and shorter in duration (usually only HSV-2)

Investigations
- viral culture preferred in patients with ulcer present, however decreased sensitivity as lesions heal
- cytologic smear (Tzanck smear) shows multinucleated giant cells, acidophilic intranuclear inclusion bodies
- HSV DNA PCR
- type specific serologic tests for antibodies to HSV-1 and HSV-2 (not available routinely in Canada)

Genital Warts During Pregnancy
- Condyloma tend to get larger in pregnancy and should be treated early (consider excision)
- C-section only if obstructing birth canal or risk of extensive bleeding
- Do not use imiquimod, podophyllin, or podofilox

Human Rights in Health Equity: Cervical Cancer and HPV Vaccines
- While cervical cancer rates have drastically fallen in developed countries due to effective prevention and treatment, socially disadvantaged women within these countries remain disproportionately more likely to develop and die of cervical cancer.
- In most developing countries cervical cancer rates have risen or remained unchanged.
- Must recognize that cervical cancer disparities between race, urban and rural residence, and high and low socioeconomic status are attributed to disparate screening and vaccination coverage.
- Programs are implemented without sufficient attention to conditions that render screening less effective or inaccessible to disadvantaged social groups including: lack of information, undervaluing of preventive care, opportunistic delivery in limited health care settings, sexual health stigma, and related privacy concerns.

A 9-Valent HPV Vaccine Against Infection and Intraepithelial Neoplasia in Women

Method: International randomized, double-blinded phase 2B-3 study of 9 HPV vaccine in 14,215 women between ages of 16-26. Participants were randomized to the 9vHPV vaccine group or the qHPV vaccine group and each received a series of three IM injections (day 1, 2 and 6 months). Swabs of labial, vulvar, perineal, perianal, endocervical, and ectocervical tissue was obtained and used for HPV DNA testing/Pap smear.

Results: Rate of high-grade cervical, vulvar, or vaginal disease was 14.0 per 1,000 person-years in both vaccine groups. The rate of high-grade cervical, vulvar, or vaginal disease related to HPV-31, 33, 45, 52, and 58 was 0.1 per 1,000 person-years in the qHPV group and 1.6 per 1,000 person-years in the 9vHPV group (85% CI = 80.9-99.0). Antibody responses to HPV 6, 11, 16, and 18 were not significantly different between the two vaccine groups although adverse events related to injection sites were more common in the qHPV group.

Conclusions: The 9vHPV vaccine was non-inferior to qHPV vaccine in preventing infection and disease related to HPV-6, 11, 16, and 18 and also covered additional oncogenic types HPV-31, 33, 45, 52, and 58 in a susceptible population.
Treatment
• first episode
  ■ acyclovir 200 mg PO five times daily x 5-10 d, or famciclovir 250 mg PO tid x 7-10 5 d, or valacyclovir 1 g PO bid x 10 d
• recurrent episode
  ■ acyclovir 200 mg PO five times daily x 5 d, or famciclovir 125 mg PO bid x 5 d, or valacyclovir 500 mg PO bid OR 1 g PO OD x 3 d
• daily suppressive therapy
  ■ consider for > 6 recurrences per yr or one every 2 mo
  ■ acyclovir 400 mg PO bid, or famciclovir 250 mg bid, or valacyclovir 0.5-1 g PO OD
• severe disease: consider IV therapy: acyclovir 55 mg/kg IV over 60 min q8h
• education regarding transmission
• avoid contact from onset of prodrome until lesions have cleared
• use barrier contraception

SYPHILIS

Etiology
• Treponema pallidum

Classifications
• primary syphilis
  ■ 3-4 wk after exposure
  ■ painless chancre on vulva, vagina, or cervix
  ■ painless inguinal lymphadenopathy
  ■ serological tests usually negative, local infection only
• secondary syphilis (can resolve spontaneously)
  ■ 2-6 mo after initial infection
  ■ nonspecific symptoms: malaise, anorexia, headache, diffuse lymphadenopathy
  ■ generalized maculopapular rash: palms, soles, trunk, limbs
  ■ condylomata lata: anogenital, broad-based fleshy grey lesions
  ■ serological tests usually positive
• latent syphilis
  ■ no clinical manifestations; detected by serology only
• tertiary syphilis
  ■ may involve any organ system
  ■ neurological: tabes dorsalis, general paresis
  ■ cardiovascular: aortic aneurysm, dilated aortic root
  ■ vulvar gumma: nodules that enlarge, ulcerate and become necrotic (rare)
• congenital syphilis
  ■ may cause fetal anomalies, stillbirths, or neonatal death

Investigations
• aspiration of ulcer serum or node
• darkfield microscopy (most sensitive and specific diagnostic test for syphilis)
  ■ spirochetes
• non-treponemal screening tests (VDRL, RPR); nonreactive after adequate treatment
• specific anti-treponemal antibody tests (FTA-ABS, MHA-TP, TP-PA)
  ■ confirmatory tests; remain reactive for life (even after adequate treatment)

Treatment
• treatment of primary, secondary, latent syphilis of <1 yr duration
  ■ benzathine penicillin G 2.4 million units IM single dose
  ■ treat partners, reportable disease
• treatment of latent syphilis of >1 yr duration
  ■ benzathine penicillin G 2.4 million units IM q1wk x 3 wk
• treatment of neurosyphilis
  ■ IV aqueous penicillin G 3-4 million units IM q12h x 10-14 d
• screening
  ■ high risk groups
  ■ in pregnancy (see Obstetrics, Table Infections During Pregnancy, OB29)

Complications
• if untreated, 1/3 will experience late complications

HIV
• see Infectious Diseases, ID27
Bartholin Gland Abscess

Etiology
- often anaerobic and polymicrobial
- \textit{U. urealyticum, N. gonorrhoeae, C. trachomatis, E. coli, P. mirabilis, Streptococcus spp., S. aureus} (rare)
- blockage of duct

Clinical Features
- unilateral swelling and pain in inferior lateral opening of vagina
- sitting and walking may become difficult and/or painful

Treatment
- sitz baths, warm compresses
- antibiotics: cephalexin x 1 wk
- incision and drainage using local anesthesia with placement of Word catheter (10 French latex catheter) for 2-3 wk (or as long as stays insitu)
- marsupialization under general anesthetic – more definitive treatment
- rarely treated by removing gland

Pelvic Inflammatory Disease

- up to 20% of all gynecology-related hospital admissions

Etiology
- causative organisms (in order of frequency)
  - \textit{C. trachomatis}
  - \textit{N. gonorrhoeae}
    - gonorrhea and chlamydia often co-exist
  - endogenous flora: anaerobic, aerobic, or both
    - \textit{E. coli, Staphylococcus, Streptococcus, Enterococcus, Bacteroides, Peptostreptococcus, H. influenzae, G. vaginalis}
    - cause of recurrent PID
    - associated with instrumentation
  - \textit{Actinomyces israelii} (Gram-positive, non acid-fast anaerobe)
    - 1-4% of PID cases associated with IUDs
    - others (TB, Gram-negatives, CMV, U. urealyticum, etc.)

Risk Factors
- age <30 yr
- risk factors as for chlamydia and gonorrhea
- vaginal douching
- IUD (within first 10 d after insertion)
- invasive gynecologic procedures (D&C, endometrial biopsy)

Clinical Presentation
- up to 2/3 asymptomatic: many subtle or mild symptoms
- common: fever >38.3º C, lower abdominal pain and tenderness, abnormal discharge: cervical or vaginal
- uncommon: N/V, dysuria, AUB
- chronic disease (often due to chlamydia)
  - constant pelvic pain
  - dyspareunia
  - palpable mass
  - very difficult to treat, may require surgery

Investigations
- blood work
  - β-hCG (must rule out ectopic pregnancy), CBC, blood cultures if suspect septicemia
- urine R&M
- speculum exam, bimanual exam
  - vaginal swab for Gram stain, C&S
  - cervical cultures for \textit{N. gonorrhoeae, C. trachomatis}
  - endometrial biopsy will give definitive diagnosis (rarely done)
- ultrasound
  - may be normal
  - free fluid in cul-de-sac
  - pelvic or tubo-ovarian abscess
  - hydrosalpinx (dilated fallopian tube)
- laparoscopy (gold standard)
  - for definitive diagnosis: may miss subtle inflammation of tubes or endometritis

PID accounts for up to 20% of all gynecological hospital admissions

PID Inflammation of the upper genital tract (above cervix) including endometrium, fallopian tubes, ovaries, pelvic peritoneum, ± contiguous structures

PID Diagnosis
- Must have
  - Lower abdominal pain
- Plus one of
  - Cervical motion tenderness
  - Adnexal tenderness
  - Plus one or more of
    - High risk partner
    - Temperature >38º C
    - Mucopurulent cervical discharge
    - Positive culture for \textit{N. gonorrhoeae, C. trachomatis, E. coli}, or other vaginal flora
    - Cul-de-sac fluid, pelvic abscess or inflammatory mass on U/S or bimanual
    - Leukocytosis
    - Elevated ESR or CRP (not commonly used)
Treatment
- must treat with polymicrobial coverage
- inpatient if
  - moderate to severe illness
  - atypical infection
  - adnexal mass, tubo-ovarian mass, or pelvic abscess
  - unable to tolerate oral antibiotics or failed oral therapy
  - immunocompromised
  - pregnant
  - adolescent – first episode
  - surgical emergency cannot be excluded (e.g. ovarian torsion)
- PID is secondary to instrumentation
- recommended treatment
  - cefoxitin 2 g IV q6h (no longer available in U.S.A.) + doxycycline 100 mg IV/PO q12h or clindamycin 900 mg IV q6h + gentamicin 2 mg/kg IV/IM loading dose then gentamicin 1.5 mg/kg IV q8h maintenance dose
  - continue IV antibiotics for 24 h after symptoms have improved then doxycycline 100 mg PO bid to complete 14 d
  - percutaneous drainage of abscess under U/S guidance
  - when no response to treatment, laparoscopic drainage
  - if failure, treatment is surgical (salpingectomy, TAH/BSO)
- outpatient if
  - typical findings
  - mild to moderate illness
  - oral antibiotics tolerated
  - compliance ensured
  - follow-up within 48-72 h (to ensure symptoms not worsening)
- recommended treatment
  - ceftriaxone 250 mg IM x 1 + doxycycline 100 mg PO bid x 14 d or cefoxitin 2 g IM x 1 + probenecid 1 g PO + doxycycline 100 mg PO bid ± metronidazole 500 mg PO bid x 14 d
  - ofloxacin 400 mg PO bid x 14 d or levofloxacin 500 mg PO OD x 14 d ± metronidazole 500 mg PO bid x 14 d
  - consider removing IUD after a minimum of 24 h of treatment
  - reportable disease
  - treat partners
  - consider re-testing for C. trachomatis and N. gonorrhoeae 4-6 wk after treatment if documented infection

Complications of Untreated PID
- chronic pelvic pain
- abscess, peritonitis
- adhesion formation
- ectopic pregnancy
- infertility
  - 1 episode of PID \(\rightarrow\) 13% infertility
  - 2 episodes of PID \(\rightarrow\) 36% infertility
- bacteremia
- septic arthritis, endocarditis

Toxic Shock Syndrome
- see Infectious Diseases, ID23

Risk Factors
- tampon use
- diaphragm, cervical cap, or sponge use (prolonged use, i.e. >24 h)
- wound infections
- post-partum infections
- early recognition and treatment of syndrome is imperative as incorrect diagnosis can be fatal

Clinical Presentation
- sudden high fever
- sore throat, headache, diarrhea
- erythoderma
- signs of multisystem organ failure
- refractory hypotension
- exfoliation of palmar and plantar surfaces of the hands and feet 1-2 wk after onset of illness
Treatment
- remove potential sources of infection (foreign objects and wound debris)
- debride necrotic tissues
- adequate hydration
- penicillinase-resistant antibiotics, e.g. cloxacillin
- steroid use controversial but if started within 72 h, may reduce severity of symptoms and duration of fever

Surgical Infections
Post-Operative Infections in Gynecological Surgery
- pelvic cellulitis
  - common post hysterectomy, affects vaginal vault
  - erythema, induration, tenderness, discharge involving vaginal cuff
  - treat if fever and leukocytosis with broad spectrum antibiotics, i.e. clindamycin and gentamicin
  - drain if excessive purulence or large mass
  - can result in intra-abdominal and pelvic abscess
- see General Surgery, Post-Operative Fever, GS7

Sexual Abuse
- see Family Medicine, FM26, Emergency Medicine, ER27

Sexuality and Sexual Dysfunction

SEXUAL RESPONSE
1. desire: energy that allows an individual to initiate or respond to sexual stimulation
2. arousal: physical and emotional stimulation leading to breast and genital vasodilation and clitoral engorgement
3. orgasm: physical and emotional stimulation is maximized, allowing the individual to relinquish their sense of control
4. resolution: most of the congestion and tension resolves within seconds, complete resolution may take up to 60 min

SEXUAL DYSFUNCTION

Etiology
- psychological or emotional: depression, abuse
- hormonal: menopause
- neurologic dysfunction: spinal cord injury
- vascular insufficiency: DM
- drug side effects: β-blockers
- trauma: episiotomy

Classification
- lack of desire (60-70% of women)
- lack of arousal
- anorgasmia (5-10%)
  - primary anorgasmia: never before achieved orgasm under any circumstances
  - secondary anorgasmia: was able to achieve orgasm before but now unable to
- dyspareunia (3-6%): painful intercourse, superficial or deep
  - vaginismus (15%)
  - vulvodynia
  - vaginal atrophy
  - vulvar vestibulitis: associated with history of frequent yeast infections
  - PID

Treatment
- lack of desire: assess factors, rule out organic causes, relationship therapy, sensate focus exercises
- anorgasmia: self-exploration/pleasuring, relationship therapy if needed, bridging techniques (different sexual positions, clitoral stimulation during intercourse)
- dyspareunia
  - Kegel and reverse Kegel exercises
  - dilator treatment
  - comfort with self-exam
  - psychotherapy, other behavioural techniques
  - female on top position: allows for control of speed and duration
  - vestibulitis: remove local irritants, change in contraceptive methods, dietary changes (increased citrate, decreased oxalate), and vestibulectomy (rare)
  - vulvodynia: local moisturization, cold compresses, systemic nerve blocking therapy (amitriptyline, gabapentin) orally or topically, topical anesthetics, estrogen cream
  - pain clinic

Dyspareunia Cycle
- Painful intercourse (initially due to organic etiology)
- 2nd vaginismus
- Fear of pain with intercourse
- Anxiety with or without sexual response

Figure 20. Dyspareunia Cycle

Kegel Exercises
- Regular contraction and relaxation to strengthen pelvic floor muscles

Reverse Kegel Exercises
- 1 s contraction then 5 s of relaxation

Figure 20. Dyspareunia Cycle
Menopause

• see Family Medicine, FM40

Definitions
• lack of menses for 1 yr
• types of menopause
  ▪ physiological; average age 51 yr (follicular atresia)
  ▪ premature ovarian failure; before age 40 (autoimmune disorder, infection, Turner’s syndrome)
  ▪ iatrogenic (surgical/radiation/chemotherapy)

Clinical Features
• associated with estrogen deficiency
  ▪ vasomotor instability (tends to dissipate with time)
  ▪ hot flushes/flushes, night sweats, sleep disturbances, formication, nausea, palpitations
  ▪ urogenital atrophy involving vagina, urethra, bladder
  ▪ dyspareunia, pruritus, vaginal dryness, bleeding, urinary frequency, urgency, incontinence
  ▪ skeletal
  ▪ osteoporosis, joint and muscle pain, back pain
  ▪ skin and soft tissue
  ▪ decreased breast size, skin thinning/loss of elasticity
  ▪ psychological
  ▪ mood disturbance, irritability, fatigue, decreased libido, memory loss

Investigations
• increased levels of FSH (>35 IU/L) on day 3 of cycle (if still cycling) and LH (FSH>LH)
• FSH level not always predictive due to monthly variation; use absence of menses for 1 yr to diagnose
• decreased levels of estradiol (later)

Treatment
• goal is for individual symptom management
  ▪ vasomotor instability
    ▪ HRT (first line), SSRIs, venlafaxine, gabapentin, propranolol, clonidine
    ▪ acupuncture
  ▪ vaginal atrophy
    ▪ local estrogen: cream (Premarin®), vaginal suppository (VagiFem®), ring (Estring®)
    ▪ lubricants (Replens®)
  ▪ urogenital health
  ▪ lifestyle changes (weight loss, bladder re-training), local estrogen replacement, surgery
  ▪ osteoporosis
    ▪ 1,000-1,500 mg calcium OD, 800-1,000 IU vitamin D, weight-bearing exercise, smoking cessation
    ▪ bisphosphonates (e.g. alendronate)
    ▪ selective estrogen receptor modifiers (SERMs): raloxifene (Evista®) – mimics estrogen effects on bone, avoids estrogen-like action on breast and uterine cancer; does not help hot flashes
    ▪ HRT: second-line treatment (unless for vasomotor instability as well)
    ▪ decreased libido
    ▪ vaginal lubrication, counselling, androgen replacement (testosterone cream or the oral form Andriol®)
  ▪ cardiovascular disease
    ▪ management of cardiovascular risk factors
  ▪ mood and memory
    ▪ antidepressants (first line), HRT (augments effect)
    ▪ alternative choices (not evidence-based, safety not established)
      ▪ black cohosh, phytoestrogens, St. John’s wort, ginkgo biloba, valerian, evening primrose oil, ginseng, Don Quai

Hormone Replacement Therapy
• see Family Medicine, FM40
• primary indication is treatment of menopausal symptoms (vasomotor instability)
• keep doses low (e.g. 0.3 mg Premarin®) and duration of treatment short (<5 yr)

HRT Components
• estrogen
• oral or transdermal (e.g. patch, gel)
• transdermal preferred for women with hypertriglyceridemia or impaired hepatic function, smokers, and women who suffer from headaches associated with oral HRT

Menopause
Occurrence of last spontaneous menstrual period, resulting from loss of ovarian function (loss of oocyte response to gonadotropins)

“Being in menopause”
Lack of menses for 1 yr

Perimenopause
Period of time surrounding menopause (2-8 yr preceding + 1 yr after last menses) characterized by fluctuating hormone levels, irregular menstrual cycles, and symptom onset

• 85% of women experience hot flashes
• 20-30% seek medical attention
• 10% are unable to work

Menopause Pathophysiology
Degenerating theca cells fail to react to endogenous gonadotropins (FSH, LH)
  ▪ Less estrogen is produced
  ▪ Decreased negative feedback on hypothalamic-pituitary-adrenal axis
  ▪ Increased FSH and LH
  ▪ Stromal cells continue to produce androgens as a result of increased LH stimulation

Figure 21. Menopause pathophysiology

• Osteoporosis is the single most important health hazard associated with menopause
• Cardiovascular disease is the leading cause of death post-menopause
• Increased risk of breast cancer (RR 1.3) is associated with estrogen + progesterone HRT, but not with estrogen-only HRT
• All women taking HRT should have periodic surveillance and counselling regarding its benefits and risks
- low-dose (preferred dose: 0.3 mg Premarin®/25 µg Estradot® patch, can increase if necessary)
- progestin
- given in combination with estrogen for women with an intact uterus to prevent development of endometrial hyperplasia/cancer

### Table 16. Examples of HRT Regimens

<table>
<thead>
<tr>
<th>HRT Regimen</th>
<th>Estrogen Dose</th>
<th>Progestin Dose</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unopposed</td>
<td>CEE 0.625 mg PO OD</td>
<td>None</td>
<td>If no intact uterus</td>
</tr>
<tr>
<td>Standard-dose</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA 2.5 mg PO OD, or micronized progesterone 100 mg PO OD</td>
<td>Withdrawal bleeding may occur in a spotty, unpredictable manner Usually abates after 6-8 mo due to endometrial atrophy Once patient has become amenorrheic on HRT, significant subsequent bleeding episodes require evaluation (endometrial biopsy)</td>
</tr>
<tr>
<td>Standard-dose Cyclic</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA 5-10 mg PO days 1-14 only, or micronized progesterone 200 mg PO OD days 1-14 only</td>
<td>Bleeding occurs monthly after day 14 of progestin (can continue for years) PMS-like symptoms (breast tenderness, fluid retention, headache, nausea) are more prominent with cyclic HRT</td>
</tr>
<tr>
<td>Pulsatile</td>
<td>CEE 0.625 mg PO OD</td>
<td>MPA low-dose</td>
<td>3 d on, 3 d off</td>
</tr>
</tbody>
</table>
| Transdermal       | Estraderm®-Estradiol 0.05 mg/d or 0.1 mg/d Estralis®-Estradiol 140 µg/d or 250 µg/d | Estrodex®-MPA 2.5 mg PO OD Estralis®-NEA 50 µg/d | Use patch twice weekly
Use patch twice weekly
Can use oral progestins (Estrodex®)
Combined patches available (Estralis®) |
| Topical           | Estrace® 2.4 g/d x 1-2 wk, 1 g/d maintenance Premarin® 0.5-2 g/d for 21 d then off 7 d for vaginal atrophy, 0.5 g/d for 21 d then off 7 d or twice/wk for dyspareunia Estragyn® 2-4 g/d | Crinone® 4% or 8% (45 or 90 mg applicator) | If simultaneously taking oral estrogen tablet, may need to adjust dosing
If intact uterus, also take progestosterone |

CEE = conjugated equine estrogen (e.g. Premarin®); MPA = medroxyprogesterone acetate (e.g. Provera®); NEA = norethindrone acetate
Consider lower dose regimens; PREMPRO® 0.4/1.5 (Premarin® 0.45 mg and Provera® 1.5 mg); Estrace® (topical 17β-estradiol) = 0.1 mg active ingredient/g; Premarin® (topical CEE) = 0.625 mg active ingredient/g; Estragyn® (topical estrone) = 1 mg active ingredient/g

### Side Effects of HRT
- abnormal uterine bleeding
- mastodynia – breast tenderness
- edema, bloating, heartburn, nausea
- mood changes (progestosterone)
- may be worse in progesterone phase of combined therapy

### Contraindications to HRT
- absolute
  - acute liver disease
  - undiagnosed vaginal bleeding
  - known or suspected uterine cancer/breast cancer
  - acute vascular thrombosis or history of severe thrombophlebitis or thromboembolic disease
  - cardiovascular disease
- relative
  - pre-existing uncontrolled HTN
  - uterine fibroids and endometriosis
  - familial hyperlipidemias
  - migraine headaches
  - family history of estrogen-dependent cancer
  - chronic thrombophlebitis
  - DM (with vascular disease)
  - gallbladder disease, hypertriglyceridemia, impaired liver function (consider transdermal estrogen)
  - fibrocystic disease of the breasts
WOMEN’S HEALTH INITIATIVE (launched in 1991)
- two non-randomized studies investigating health risks and benefits of HRT in healthy postmenopausal women 50-79 yr old
  - continuous combined HRT (CEE 0.625 mg + MPA 2.5 mg OD) in 16,608 women with an intact uterus
  - estrogen-alone (CEE 0.625 mg) in 10,739 women with a previous hysterectomy
- both arms of the trial were stopped early because of evidence of increased risk of breast cancer, stroke, PE, and CHD in the combined HRT arm, and increased risk of stroke with no CHD benefits in the estrogen-alone arm
- the apparent increase in CHD was in disagreement with results of previous observational trial
- results of the WHI study have since been challenged and revision of how CHD was diagnosed led to loss of statistical significance of the results
- benefits and risks reported as number of cases per 10,000 women each year

### Table 17. HRT Benefits vs. Risks

<table>
<thead>
<tr>
<th>Benefits</th>
<th>Risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vasomotor Symptoms: less frequent and severe with use of either combined or estrogen-alone HRT</td>
<td>Stroke: 8 additional cases with combined HRT, and 12 additional cases for estrogen alone (WHI)</td>
</tr>
<tr>
<td>Osteoporosis: 5 fewer cases of hip fractures and 47 fewer cases of all fractures with combined HRT, 6 fewer cases of hip fractures with estrogen alone</td>
<td>DVT/PE: 18 additional cases with combined HRT, and 9 additional cases for estrogen-alone (WHI)</td>
</tr>
<tr>
<td>Colon Cancer: 6 fewer cases with combined HRT (WHI) One additional case with estrogen-alone</td>
<td>CHD: 7 additional MIs with combined HRT (WHI); secondary analysis suggests greater absolute risk for women aged &gt;70 yr and for women who start HRT &gt;10 yr post-menopause</td>
</tr>
<tr>
<td>Breast Cancer: 8 additional cases with combined HRT (WHI) Risk only increased after &gt;5 yr of combined HRT use; no increased risk for estrogen-alone</td>
<td>Breast Cancer: additional cases with combined HRT (WHI)</td>
</tr>
<tr>
<td>Dementia and Mild Cognitive Impairment: 50% greater risk of developing dementia in women taking estrogen-alone after age 65; risk is greater for women taking combined HRT, risk of developing dementia was reduced for women taking HRT before age 65</td>
<td></td>
</tr>
</tbody>
</table>

### Conclusions
- HRT is not indicated for primary or secondary prevention of cardiovascular disease or dementia. Although HRT is considered effective for the prevention of postmenopausal osteoporosis, it is generally recommended as an option only for women at significant risk, for whom non-estrogen therapies are unsuitable.
### Prolapse

**Etiology**
- relaxation, weakness, or defect in the cardinal and uterosacral ligaments which normally maintain the uterus in an anteflexed position and prevent it from descending through the urogenital diaphragm (i.e. levator ani muscles)
- related to
  - vaginal childbirth
  - aging
  - decreased estrogen (post-menopause)
  - following pelvic surgery
  - increased intra-abdominal pressure (obesity, chronic cough, constipation, ascites, heavy lifting)
  - congenital (rarely)
  - ethnicity (Caucasian women > Asian or African women)
  - collagen disorders

**GENERAL CONSERVATIVE TREATMENT**
(for pelvic relaxation/prolapse and urinary incontinence)
- Kegel exercises
- local vaginal estrogen therapy
- vaginal pessary (intravaginal suspension disc)

<table>
<thead>
<tr>
<th>Table 18. Pelvic Prolapse</th>
<th>Clinical Features</th>
<th>Treatment</th>
</tr>
</thead>

</table>

### Urinary Incontinence

- see Urology, U5

#### STRESS INCONTINENCE

**Definition**
- involuntary loss of urine with increased intra-abdominal pressure (coughing, laughing, sneezing, walking, running)

**Risk Factors for Stress Incontinence in Women**
- pelvic prolapse
- pelvic surgery
- vaginal delivery
- hypoestrogenic state (post-menopause)
- age
- smoking
- neurological/pulmonary disease
Treatment
- see Prolapse, General Conservative Treatment, GY37
- surgical
  - tension-free vaginal tape (TVT), tension-free obturator tape (TOT), prosthetic/fascial slings or retropubic bladder suspension (Burch or Marshall-Marchetti-Krantz procedures)

URGE INCONTINENCE

Definition
- urine loss associated with an abrupt, sudden urge to void
- “overactive bladder”
- diagnosed based on symptoms

Etiology
- idiopathic (90%)
- detrusor muscle overactivity (“detrusor instability”)

Associated Symptoms
- frequency, urgency, nocturia, leakage

Treatment
- behaviour modification (reduce caffeine/liquid, smoking cessation, regular voiding schedule)
- Kegel exercises
- medications
  - anticholinergics: oxybutinin (Ditropan®), tolterodine (Detrol®), solifenacin (VESIcare®)
  - tricyclic antidepressants: imipramine

ENDOMETRIAL CARCINOMA

Epidemiology
- most common gynecological malignancy in North America (40%); 4th most common cancer in women
- 2-3% of women develop endometrial carcinoma during lifetime
- mean age is 60 yr
- majority are diagnosed in early stage due to detection of symptoms
- 85-90% 5 yr survival for stage I disease
- 70-80% overall 5 yr survival for all stages

Risk Factors
- General: increasing age and FHx
- Type I: excess estrogen (estrogen unopposed by progesterone)
  - obesity
  - PCOS
  - unbalanced HRT (balanced HRT is protective)
  - nulliparity
  - late menopause (> 55 yr), early menarche
  - estrogen-producing ovarian tumours (e.g. granulosa cell tumours)
  - HNPCC (hereditary non-polyposis colorectal cancer)/Lynch II syndrome
  - tamoxifen
- Type II: not estrogen-related
  - possibly tamoxifen

Classification and Clinical Features
- Type I (well-differentiated endometrioid adenocarcinoma) ~80% of cases
  - postmenopausal bleeding in majority, abnormal uterine bleeding in majority of affected pre-menopausal women (menorrhagia, intermenstrual bleeding)
- Type II (serous, clear cell carcinoma, grade 3 endometrioid, undifferentiated, carcinosarcoma) ~15% of cases
  - may not present with bleeding in early stage, more likely to present with advanced stage disease with symptoms like ovarian cancer (i.e. bloating, bowel dysfunction, pelvic pressure)

Investigations
- endometrial sampling
  - office endometrial biopsy
  - D&C ± hysteroscopy
- ± pelvic ultrasound (in women where adequate endometrial sampling not feasible without invasive methods)
- not acceptable as alternative to pelvic exam or endometrial sampling to rule out cancer

Incidence of Malignant Gynecological Lesions in North America
endometrium > ovary > cervix > vulva > vagina > fallopian tube

Risk Factors for Endometrial Cancer
COLD NUT
- Cancer (ovarian, breast, colon)
- Obesity
- Late menopause
- Diabetes mellitus
- Nulliparity
- Unopposed estrogen: PCOS, anovulation, HRT
- Tamoxifen: chronic use

Postmenopausal bleeding = endometrial cancer until proven otherwise (95% present with vaginal bleeding)

An endometrial thickness of 5 mm or more is considered abnormal in a postmenopausal woman with vaginal bleeding
Table 19. FIGO Staging of Endometrial Cancer (2009)

<table>
<thead>
<tr>

<td>Vaginal ± parametrical involvement</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Note: endocervical glandular involvement is now considered as Stage I (previously Stage II)

**FIGO:** International Federation of Gynecology and Obstetrics

**BAD-P:**
- Bleeding
- Abdominal distention
- Foul smelling vaginal discharge
- Pelvic Pressure

**Treatment**
- Surgical: hysterectomy/bilateral salpingo-oophorectomy (BSO) and pelvic washings ± pelvic and para-aortic node dissection ± omentectomy.
- Goals: diagnosis, staging, treatment, defining optimal adjuvant treatment.
- Laparoscopic approach associated with improved quality of life (optimal for most patients).
- Adjuvant radiotherapy (for improved local control in patients at risk for local recurrence) and adjuvant chemotherapy (in patients at risk for distant recurrence or with metastatic disease).
- Presence of poor prognostic factors in definitive pathology.
- Chemotherapy: often used for recurrent disease (especially if high grade or aggressive histology).
- Hormonal therapy: progestins can be used for recurrent disease (especially if low grade).

**UTERINE SARCOMA**
- Rare; 2-6% of all uterine malignancies.
- Arise from stromal components (endometrial stroma, mesenchymal or myometrial tissues).
- Behave more aggressively and are associated with worse prognosis than endometrial carcinoma; 5-yr survival is 35%.
- Vaginal bleeding is most common presenting symptom.

**Table 20. Summary of Uterine Sarcoma Subtypes and Features**

<table>
<thead>
<tr>
<th>Type</th>
<th>Epidemiology</th>
<th>Features</th>
<th>Diagnosis</th>
<th>Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PURE TYPE</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1. Leiomyosarcoma</td>
<td>Accounts for 40%</td>
<td>Histologic distinction from leiomyoma 1. Increased mitotic count (&gt;10 mitoses/10 high power fields) 2. Tumour necrosis 3. Cellular atypia</td>
<td>Often post-operatively after uterus removed for presumed fibroids Stage using FIGO 2009 staging for leiomyosarcomas and ECC</td>
<td>Hysterectomy/BSO usually No routine pelvic lymphadenectomy Adjuvant chemotherapy may be used if tumour has spread beyond uterus Radiation therapy does not improve local control or survival Poor outcomes overall, even for early stage disease</td>
</tr>
<tr>
<td>2. Endometrial Stromal Sarcoma (ESS)</td>
<td>Accounts for 10-15%</td>
<td>Abnormal uterine bleeding Good prognosis</td>
<td>Diagnosed by histology of endometrial biopsy or D&amp;C Stage using FIGO 2009 staging for leiomyosarcomas and ECC</td>
<td>Hysterectomy &amp; BSO (remove ovaries as ovarian hormones may stimulate growth) No routine pelvic lymphadenectomy Adjuvant therapy based on stage and histologic features (hormones and/or radiation) Hormonal therapy (progestins) may be used for metastatic disease</td>
</tr>
<tr>
<td>3. Undifferentiated Sarcoma</td>
<td>Accounts for 5-10%</td>
<td>Severe nuclear pleomorphism, high mitotic activity, tumour cell necrosis, and lack smooth muscle or endometrial stromal differentiation Poor prognosis</td>
<td>Often found incidentally post-operatively for abnormal bleeding</td>
<td>Treatment primarily surgical Radiation and/or chemotherapy for advanced disease or unresectable disease</td>
</tr>
</tbody>
</table>

**MIXED TYPE**

| 4. Adenosarcoma | The rarest of the uterine sarcoma Mixed tumour of low malignant potential | Present with abnormal vaginal bleeding Polypoid mass in uterine cavity | Mixture of benign epithelium with malignant low-grade sarcoma Often found incidentally at time of hysterectomy for PMB Stage using FIGO 2009 staging for adenosarcoma | Treatment is surgical with hysterectomy and BSO |

**RECLASSIFIED**

| 5. Carcinosarcoma | Most common (43%) Recently reclassified as high grade endometroid carcinoma with associated metaplasia of the mesenchyme, rather than arising separately from stroma | Both epithelial and stromal malignant elements present Tend to form bulky polypoid masses that often fill uterine cavity and extend into or through the endocervical canal – often have exetraterine disease at presentation | Diagnosed by histology of endometrial biopsy or D&C Stage using FIGO 2009 staging for endometrial cancer | Usually treated as “high grade endometrial carcinoma” since behaviour and treatment similar (i.e. surgical staging and resection of any gross metastatic disease, adjuvant chemotherapy and radiation) |

**Prognostic Factors**
- Most important is FIGO stage
- Other Prognostic Factors:
  - Age
  - Grade
  - Histologic subtype
  - Depth of myometrial invasion
  - Presence of lymphovascular space involvement (LVS)
  - Hormone receptor status

**Complications of Therapy**
- Surgical site infection
- Lymphedema
- Radiation fibrosis
- Cystitis
- Proctitis

**Uterine Sarcoma – Symptoms**
- BAD-P
- Bleeding
- Abdominal distention
- Foul smelling vaginal discharge
- Pelvic Pressure

A rapidly enlarging uterus, especially in a postmenopausal woman, should prompt consideration of leiomyosarcoma.

Ovary

BENIGN OVARIAN TUMOURS
- see Table 22
- many are asymptomatic
- usually enlarge slowly, if at all
- may rupture or undergo torsion, causing pain
  - pain associated with torsion of an adnexal mass usually originates in the iliac fossa and radiates to the flank
  - peritoneal irritation may result from an infarcted tumour – rare

MALIGNANT OVARIAN TUMOURS
- see Table 22

Epidemiology
- lifetime risk 1.4%
- in women >50 yr, more than 50% of ovarian tumours are malignant
- causes more deaths in North America than all other gynecologic malignancies combined
- 4th leading cause of cancer death in women
- 65% epithelial; 35% non-epithelial
- 5-10% of epithelial ovarian cancers are related to hereditary predisposition

Risk Factors (for epithelial ovarian cancers)
- excess estrogen
  - nulliparity
  - early menarche/late menopause
- age
- family history of breast, colon, endometrial, ovarian cancer
- race: Caucasian

Protective Factors (for epithelial ovarian cancers)
- OCP: likely due to ovulation suppression (significant reduction in risk even after 1 yr of use)
- pregnancy/breastfeeding
- salpingectomy (prophylactic)
- BSO (prophylactic surgery performed for this reason in high risk women – i.e. BRCA mutation carriers)

Screening
- no effective method of mass screening
- routine CA-125 level measurements or U/S not recommended
- high false positive rates
- controversial in high risk groups: transvaginal U/S and CA-125, starting age 30 (no consensus on interval)
  - familial ovarian cancer (>1 first degree relative affected, BRCA-1 mutation)
  - other cancers (e.g. endometrial, breast, colon)
  - BRCA-1 or BRCA-2 mutation: may recommend prophylactic bilateral oophorectomy after age 35 or when child-bearing is completed

Clinical Features
- most women with epithelial ovarian cancer present with advanced stage disease since often “asymptomatic” until disseminated disease (symptoms with early stage disease are vague and non-specific)
- when present, symptoms may include
  - abdominal symptoms (nausea, bloating, dyspepsia, anorexia, early satiety)
  - symptoms of mass effect
    - increased abdominal girth – from ascites or tumour itself
    - urinary frequency
    - constipation
  - postmenopausal bleeding; irregular menses if pre-menopausal (rare)

Ovarian Tumour Markers
- Epithelial cell – CA-125
- Stromal
- Granulosa cell – inhibin
- Sertoli-Leydig – androgens
- Germ cell
- Dysgerminoma – LDH
- Yolk sac – AFP
- Choriocarcinoma – β-hCG
- Immature Teratoma – none
- Embryonal cell – AFP + β-hCG

Diagnosis of ovarian tumours requires surgical pathology
- Any adnexal mass in postmenopausal women should be considered malignant until proven otherwise

Omental Cake: a term for ascites plus a fixed upper abdominal and pelvic mass; almost always signifies ovarian cancer
Low Malignant Potential (also called “Borderline”) Tumours
- pregnancy, OCP, and breastfeeding are protective factors
- ~15% of all epithelial ovarian tumours
- tumour cells display malignant characteristics histologically, but no invasion is identified
- able to metastasize, but not commonly
- treated primarily with surgery (BSO/omental biopsy ± hysterectomy)
- NO proven benefit of chemotherapy
- generally slow growing, excellent prognosis
  - 5 yr survival >99%
  - recurrences tend to occur late, may be associated with low grade serous carcinoma

</tbody>
</table>

Investigation of Suspicious Ovarian Mass

- women with suspected ovarian cancer based on history, physical, or investigations should be referred to a gynecologic oncologist
  - bimanual examination
  - RMI (Risk of Malignancy Index) is best tool available to assess likelihood of ovarian malignancy and need for pre-operative gynecologic oncology referral (see sidebar, GY43)
  - blood work: CA-125 for baseline, CBC, liver function tests, electrolytes, creatinine
  - radiology
  - bone scan or PET scan not indicated
  - transvaginal ultrasound best to visualize ovaries
  - CT scan abdomen and pelvis to look for metastatic disease
  - try to rule out other primary source if suspected, based on
    - occult blood per rectum: endoscopy ≠ barium enema
    - gastric symptoms, gastroscopy ≠ upper GI series
    - abnormal vaginal bleeding, endometrial biopsy to rule out concurrent endometrial cancer, colposcopy ≠ endocervical curettage to rule out cervical cancer if abnormal cervix
    - breast lesion identified or risk factors present: mammogram

</table>

**FIGO** = International Federation of Gynecology and Obstetrics
Cervix

BENIGN CERVICAL LESIONS
• Nabothian cyst/inclusion cyst
• no treatment required
• endocervical polyps
• treatment is polypectomy (office procedure)

MALIGNANT CERVICAL LESIONS

Epidemiology
• majority are SCC (95%); adenocarcinomas increasing (3%); rare subtypes include small cell, adenosquamous
• 8,000 deaths annually in North America
• annual Pap test reduces a woman’s chance of dying from cervical cancer from 0.4% to 0.05%
• average age at presentation: 52 yr old

Etiology
• at birth, vagina is lined with squamous epithelium; columnar epithelium lines only the endocervix and the central area of the ectocervix (original squamocolumnar junction)
• during puberty, estrogen stimulates eversion of a single columnar layer (ectopy), thus exposing it to the acidic pH of the vagina, leading to metaplasia (change of exposed epithelium from columnar to squamous)
  • a new squamocolumnar junction forms as a result
  • the transformation zone (TZ) is the area located between the original and the current squamocolumnar junction
  • the majority of dysplasias and cancers arise in the TZ of the cervix
• must have active metaplasia in presence of inducing agent (HPV) to get dysplasia
  • dysplasia → carcinoma in situ (CIS) → invasion
• slow process (~10 yr on average)
• growth is by local extension
• metastasis occurs late

Risk Factors
• HPV infection
  • see Sexually Transmitted Infections, GY27
  • high risk of neoplasia associated with types 16, 18
  • low risk of neoplasia associated with types 6, 11
  • >99% of cervical cancers contain one of the high risk HPV types
• high risk behaviours (risk factors for HPV infection)
  • multiple partners
  • other STIs (HSV, trichomonas)
• early age at first intercourse
• high risk male partner
• smoking
• poor screening uptake is the most important risk factor for cervical cancer in Canada
• at-risk groups include
  • immigrant Canadians
  • First Nations Canadians
  • geographically isolated Canadians
  • sex-trade workers
  • low socioeconomic status

Cervical Cancer Screening Guidelines (Pap Test)
• see Family Medicine, FM5

Clinical Features
• SCC: exophytic, fungating tumour
• adenocarcinoma: endophytic, with barrel-shaped cervix
• early
  • asymptomatic
  • discharge: initially watery, becoming brown or red
  • postcoital bleeding
• late
  • 80-90% present with bleeding: either postcoital, postmenopausal or irregular bleeding
  • pelvic or back pain (extension of tumour to pelvic walls)
  • bladder/bowel symptoms
• signs
  • friable, raised, reddened, or ulcerated area visible on cervix

A Risk of Malignancy Incorporating CA125, Ultrasound, and Menopausal Status for the Accurate Pre-Operative Diagnosis of Ovarian Cancer
BJOG 1990;97:922-929
RMI = U x M x CA-125
Ultrasound Findings (1 pt for each)
• Multicystic cyst
• Evidence of solid areas
• Evidence of metastases
• Presence of ascites
• Bilateral lesions
U = 1 (for U/S scores of 0 or 1)
U = 4 (for U/S scores of 2-6)
Menopausal Status
• Postmenopausal: M = 4
• Premenopausal: M = 1
Absolute Value of CA-125 Serum Level
• For RMI>200: Gynecologic oncology referral is recommended

Cervical cancer is most prevalent in developing countries and therefore is the only gynecologic cancer that uses clinical staging; this facilitates consistent international staging with countries that do not have technologies, such as CT and MRI.
Diagnosis
- apply acetic acid and identify acetowhite lesions, punctuation, mosaicism, and abnormal blood vessels to guide cervical biopsy
- endocervical curettage (ECC) if entire lesion is not visible or no lesion visible
- diagnostic excision (LEEP) if
  - lesion extends into endocervical canal
  - positive ECC
  - discrepancy between Pap test results and colposcopy
- microinvasive carcinoma
- consider cold knife conization (in OR) if glandular abnormality suspected based on cytology or colposcopic findings due to concern for margin interpretation
- tests permitted for FIGO clinical staging include: physical exam (including examination under anesthesia), cervical biopsy (including cone biopsy), proctoscopy/cystoscopy, IVP, ultrasound liver/kidneys, CXR, LFTs
- MRI and/or CT and/or PET scan can often done to facilitate planning of radiation therapy, results do not influence clinical stage

*Gardasil-9 also covers types 31, 33, 45, 52, and 58; also used to prevent genital warts.

Abnormal Pap Tests in Pregnancy
- should be administered before onset of sexual activity (i.e. before exposure to virus) for optimal benefit of vaccination
- may be given at the same time as hepatitis B or other vaccines using a different injection site
- not for treatment of active infections
- most women will not be infected with all four types of the virus at the same time, therefore vaccine is still indicated for sexually active females or those with a history of previous HPV infection or HPV-related disease
- conception should be avoided until 30 d after last dose of vaccination

</tr>
<tr>
<td>If discrepancy remains, excisional biopsy may be considered</td>
</tr>
</tbody>
</table>

| **CIN II and CIN III** |
| Women ≤25 y: |
| CIN II or III should be treated |
| Excisional procedures preferred for CIN III |
| Those with positive margins should have follow-up with colposcopy and directed biopsies and/or endocervical curettage |
| Treatment for recurrent CIN II or III should be by excision |
| Women <25 y: |
| Pathologist should be asked to clarify whether lesion is CIN II or CIN III |
| CIN II: observe with colposcopy at 6-mo intervals for up to 24 mo before treatment considered |
| CIN III: should be treated |
| During pregnancy: |
| CIN II or III suspected or diagnosed during pregnancy, repeat colposcopy and treatment delayed until 8-12 wk after delivery |

| **Stage IA1 (no LVI)** |
| Trachelectomy (removal of only the cervix) if future fertility desired (and lesion ≤2 cm) |
| Simple hysterectomy if future fertility is not desired |

| **Stage IA2, IB1** |
| Typically treated with radical hysterectomy and pelvic lymphadenectomy (sentinel nodes under study) |
| Equal cure rates may be obtained with primary radiation therapy; advantage of surgery: may accurately stage and grade and more targeted adjuvant therapy |
| Advantage is that ovaries can be spared if pre-menopausal |
| For fertility preservation, may have radical trachelectomy (removal of cervix and parametria) and nodes instead of radical hysterectomy for early-stage disease |
| Concurrent chemoradiation therapy if adverse high risk prognostic factors on radical surgical specimen, such as: positive pelvic lymph nodes, positive parametria, and/or positive margins |

| **Stages IB2 (>4 cm), II, III, IV** |
| Primary chemoradiation therapy |
| PET/CT to grade: evaluate pelvic and para-aortic nodes |
| For positive nodes on PET: primary chemoradiation with extended field RT |
| Hysterectomy generally not suggested following primary treatment with curative intent |

Selected Outcomes: Development of HPV-16/18 associated CIN II+ was the primary outcome. Secondary to this were persistence of infections with HPV-16, HPV-18, or other oncogenic HPV types.

**Conclusions:** The HPV-16/18 AS04-adjuvanted vaccine protected against HPV-16/18 associated CIN II+ lesions and lesions associated with HPV-31, HPV-33, and HPV-45.
**Vulva**

**BENIGN VULVAR LESIONS**

**Non-Neoplastic Disorders of Vulvar Epithelium**
- biopsy is necessary to make diagnosis and/or rule out malignancy
- hyperplastic dystrophy (squamous cell hyperplasia)
  - surface thickened and hyperkeratotic
  - pruritus most common symptom
  - typically postmenopausal women
  - treatment: 1% fluorinated corticosteroid ointment bid for 6 wk
- lichen sclerosis
  - subepithelial fat becomes diminished; labia become thin, atrophic, with membrane-like epithelium and labial fusion
  - pruritus, dyspareunia, burning
  - ‘figure of 8’ distribution
  - most common in postmenopausal women but can occur at any age
  - treatment: ultrapotent topical steroid 0.05% clobetasol x 2-4 wk then taper down, can consider long term suppression twice a week
- mixed dystrophy (lichen sclerosis with epithelial hyperplasia)
  - hyperkeratotic areas with areas of thin, shiny epithelium
  - treatment: fluorinated corticosteroid ointment

**Tumours**
- papillary hidradenoma, nevus, fibroma, hemangioma

**MALIGNANT VULVAR LESIONS**

**Epidemiology**
- 5% of genital tract malignancies
- 90% SCC, remainder melanomas, basal cell carcinoma, Paget’s disease, Bartholin’s gland carcinoma
  - Type I disease: HPV-related (50-70%)
    - more likely in younger women
  - 90% of VIN contain HPV DNA (usually types 16, 18)
  - Type II disease: not HPV-related, associated with current or previous vulvar dystrophy
    - usually postmenopausal women

**Risk Factors**
- HPV infection
- vulvar intraepithelial neoplasia (VIN): precancerous change which presents as multicentric white or pigmented plaques on vulva (may only be visible at colposcopy)
  - progression to cancer rarely occurs with appropriate management
- treatment: local excision (i.e. superficial vulvectomy ± split thickness skin grafting to cover defects if required) vs. ablative therapy (i.e. laser, cauterization) vs. local immunotherapy (imiquimod)

**Clinical Features**
- many patients asymptomatic at diagnosis (many also deny or minimize symptoms)
- most lesions occur on the labia majora, followed by the labia minora (less commonly on the clitoris or perineum)
  - localized pruritus or lesion most common
- less common: raised red, white or pigmented plaque, ulcer, bleeding, discharge, pain, dysuria
- patterns of spread
  - local
  - groin lymph nodes (usually inguinal → pelvic nodes)
  - hematogenous

**Investigations**
- ± colposcopy
  - ALWAYS biopsy any suspicious lesion

**Prognosis**
- depends on stage – particularly nodal involvement (single most important predictor followed by tumour size)
- lesions >4 cm associated with poorer prognosis
- overall 5 yr survival rate: 79%
BENIGN VAGINAL LESIONS

- inclusion cysts
  - cysts form at site of abnormal healing of laceration (e.g. episiotomy)
  - no treatment required
- endometriosis
  - dark lesions that tend to bleed at time of menses
  - treatment: excision
- Gartner's duct cysts
  - remnants of Wolffian duct, seen along side of cervix
  - treatment: conservative unless symptomatic
- urethral diverticulum
  - can lead to recurrent urethral infection, dyspareunia
  - treatment: surgical correction if symptomatic

MALIGNANT VAGINAL LESIONS

Epidemiology

- primary carcinomas of the vagina represent 2-3% of malignant neoplasms of the female genital tract
- 80-90% are SCC
- more than 50% diagnosed between 70-90 yr old

Risk Factors

- associated with HPV infection (analogous to cervical cancer)
- increased incidence in patients with prior history of cervical and vulvar cancer

Investigations

- cytology
  - significant false negative rate for existing malignancy (i.e. if gross lesion present, biopsy!)
- colposcopy
- Schiller test (normal squamous epithelium takes up Lugol's iodine)
- biopsy, partial vaginectomy (wide local excision for diagnosis)
- rule out disease on cervix, vulva, or anus (most vaginal cancers are actually metastatic from one of these sites)
- staging

Clinical Features

</tbody>
</table>

Fallopian Tube

- least common site for carcinoma of female reproductive system (0.3%)
- usually serous epithelial carcinoma
- recently considered to be origin of serous ovarian cancer
- more common in fifth and sixth decade

Clinical Features

- classic triad present in minority of cases, but very specific
  - watery discharge (most specific) = “hydrops tubae profluens”
  - vaginal bleeding or discharge in 50% of patients
  - crampy lower abdominal/pelvic pain
  - most patients present with a pelvic mass (see Ovarian Tumours, GY40 for guidelines regarding diagnosis/investigation)

Treatment

- as for malignant epithelial ovarian tumours
Gestational Trophoblastic Disease/Neoplasia

• refers to a spectrum of proliferative abnormalities of the trophoblast

Epidemiology
• 1/1,000 pregnancies
• marked geographic variation – as high as 1/125 in Taiwan
• 80% benign, 15% locally invasive, 5% metastatic
• cure rate >95%

HYDATIDIFORM MOLE (Benign GTD)

Complete Mole
• most common type of hydatidiform mole
• diffuse trophoblastic hyperplasia, hydropic swelling of chorionic villi, no fetal tissues, or membranes present
• 46XX or 46XY, chromosomes completely of paternal origin (90%)
• 2 sperm fertilize empty egg or 1 sperm with reduplication
• 15-20% risk of progression to malignant sequelae
• risk factors
  ■ geographic (South East Asia most common)
  ■ others (maternal age >40 yr, β-carotene deficiency, vitamin A deficiency) – not proven
• clinical features
  • often present during apparent pregnancy with abnormal symptoms/findings
    • vaginal bleeding (97%)
    • excessive uterine size for LMP (51%)
    • theca-lutein cysts >6 cm (50%)
    • preeclampsia (27%)

Partial (or Incomplete) Mole
• focal trophoblastic hyperplasia and hydropic villi are associated with fetus or fetal parts
• often triploid (XXX, XYY, XXX) with chromosome complement from both parents
  ■ usually related to single ovum fertilized by two sperm
• low risk of progression to malignant sequelae (<4%)
• associated with fetus, which may be growth-restricted, and/or have multiple congenital malformations
• clinical features
  ■ typically present similar to threatened/spontaneous/missed abortion
  ■ pathological diagnosis often made after D&C

Investigations
• quantitative β-hCG levels (tumour marker) abnormally high for gestational age
• U/S findings
  ■ if complete: no fetus (classic "snow storm" due to swelling of villi)
  ■ if partial: molar degeneration of placenta ± fetal anomalies, multiple echogenic regions corresponding to hydropic villi, and focal intrauterine hemorrhage
• CXR (may show metastatic lesions)
• features of molar pregnancies at high risk of developing persistent GTN post-evacuation
  ■ local uterine invasion as high as 31%
  ■ β-hCG >100,000 IU/L
  ■ excessive uterine size
  ■ prominent theca-lutein cysts

Treatment
• suction D&C with sharp curettage and oxytocin
• Rhogam® if Rh negative
• consider hysterectomy (if patient no longer desires fertility)
• prophylactic chemotherapy of no proven benefit
• chemotherapy for GTN if develops after evacuation

Follow-Up
• contraception required to avoid pregnancy during entire follow-up period
• serial β-hCGs (as tumour marker) every week until negative x 3 (usually takes several wk), then monthly for 6-12 mo prior to trying to conceive again
• increase or plateau of β-hCG indicates GTN → patient needs chemotherapy

With development of hypertension early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease
GTN (MALIGNANT GTD)

Invasive Mole or Persistent GTN
- diagnosis made by rising or plateau in β-hCG, development of metastases following treatment of documented molar pregnancy
- histology: molar tissue from D&C
- metastases are rare (4%)

Choriocarcinoma
- often present with symptoms from metastases
- highly anaplastic, highly vascular
- no choriocarcinoma, elements of syncytiotrophoblast and cytotrophoblast
- may follow molar pregnancy, abortion, ectopic, or normal pregnancy

Placental-Site Trophoblastic Tumour
- rare aggressive form of GTN
- abnormal growth of intermediate trophoblastic cells
- low β-hCG, production of human placental lactogen (hPL), relatively insensitive to chemotherapy

CLASSIFICATION OF GTN
- non-metastatic
  - ~15% of patients after molar evacuation
  - may present with abnormal bleeding
  - all have rising or plateau of β-hCG
  - negative metastases on staging investigations
- metastatic
  - 4% patients after treatment of complete molar pregnancy
  - metastasis more common with choriocarcinoma which tends toward early vascular invasion and widespread dissemination
  - if signs or symptoms suggest hematogenous spread, do not biopsy (they bleed)
    - lungs (80%): cough, hemoptysis, CXR lesion(s)
    - vagina (30%): vaginal bleeding, “blue lesions” on speculum exam
    - pelvis (20%): rectal bleeding (if invades bowel), U/S lesion(s)
    - liver (10%): elevated LFTs, U/S or CT findings
    - brain (10%): headaches, dizziness, seizure (symptoms of space-occupying lesion), CT/MRI findings
  - highly vascular tumour → bleeding → anemia
  - all have rising or plateau of β-hCG
- classification of metastatic GTN
  - divided into good prognosis and bad prognosis
  - features of bad prognosis
    - long duration (>4 mo from antecedent pregnancy)
    - high pre-treatment β-hCG titre: >100,000 IU/24 h urine or >40,000 IU/L of blood
    - brain or liver metastases
    - prior chemotherapy
  - metastatic disease following term pregnancy
  - good prognosis characterized by the absence of each of these features

Investigations – For Staging
- blood work: CBC, electrolytes, creatinine, β-hCG, TSH, LFTs
- imaging: CXR, U/S pelvis, CT abdo/pelvis, CT brain
- if suspect brain metastasis but CT brain negative, consider lumbar puncture for CSF β-hCG
- ratio of plasma β-hCG:CSF β-hCG <60 indicates metastases

**Follow-up (for GTN)**
- contraception for all stages to avoid pregnancy during entire follow-up period
- stage I, II, III
  - weekly β-hCG until 3 consecutive normal results
  - then monthly x 12 mo
- stage IV
  - weekly β-hCG until 3 consecutive normal results
  - then monthly x 24 mo

**GTN Diagnosis**
- β-hCG plateau: <10% drop in β-hCG over four values in 3 wk (e.g., days 1, 7, 14, and 21) OR
- β-hCG rise >20% in any two values over two wk or longer (e.g., measure at days 1, 7, 14) OR
- β-hCG persistently elevated >6 mo OR
- metastases on workup

</tbody>
</table>
| doxycycline            | Tetracycline derivative; inhibit protein synthesis | 100 mg PO bid x 7 d | Chlamydia, gonococcal infection, syphilis | S/E: GI upset, hepatotoxicity  
 C/I: pregnancy, severe hepatic dysfunction  
 D/I: warfarin, digoxin |
| fluconazole (Diflucan®) | Antifungal, disrupt fungal cell membrane | 150 mg PO x 1 dose | Vulvovaginal candidiasis unresponsive to clotrimazole | S/E: headache, rash, N/V, abdominal pain, diarrhea  
 C/I: terfenadine, cisapride, astemizole, hydrochlorothiazide, phenytoin, warfarin, rifampin |
| leuprolide (Lupron®)   | Synthetic GnRH analog Induces reversible hypoestrogenic state | 3.75 mg IM q1mo or 11.25 mg IM q3mo Usually x8 mo, check bone density if > 6 mo  
 Treatment with Lupron® alone not recommended because of effects on bone density | Endometriosis Leiomymoma DUB Precocious puberty | S/E: hot flashes, sweats, headache, vaginitis, reduction in bone density, acne, GI upset  
 C/I: pregnancy, undiagnosed vaginal bleeding, breastfeeding |
| metronidazole (Flagyl®) | Bactericidal; forms toxic metabolites which damage bacterial DNA | 2 g PO x 1 dose or 500 mg PO bid x 7 d | Bacterial vaginosis, trichomonas vaginitis | S/E: headache, dizziness, N/V, diarrhea, disulfiram-like reaction (flushing, tachycardia, N/V)  
 C/I: pregnancy (1st trimester)  
 D/I: cisapride, warfarin, cimetidine, lithium, alcohol, amiodarone, milk thistle, carbamazepine |
| oxybutinin (Ditropan®) | Anticholinergic – relaxes bladder smooth muscle, inhibits involuntary detrusor contraction | 5-10 mg/d PO  
 May increase doses by 5 mg weekly to a max of 30 mg/d | Overactive bladder (urge incontinence) | S/E: dry mouth/eyes, constipation, palpitations, urinary retention, dizziness, headache  
 C/I: glaucoma, GI ulcers, severe colitis, obstructive uropathy, use with caution if impaired hepatic/renal function |
| tolterodine (Detrol®)  | Anticholinergic | 1-2 mg PO bid | Overactive bladder (urge incontinence) | S/E: anaphylaxis, psychosis, tachycardia, dry mouth/eyes, headache, constipation, urinary retention, chest pain, abdominal pain  
 C/I: glaucoma, gastric/urinary retention, use with caution if impaired hepatic/renal function |
| tranexamic acid (Cyklokapron®) | Anti-BHnanalytic, reversibly inhibits plasminogen activation | 1-1.5 g tid-qid for first 4 d of cycle  
 Ophthalmic check if used for several wk | Menorrhagia | S/E: N/V, diarrhea, dizziness, rare cases of thrombosis, abdominal pain, NSX pain  
 C/I: thromboembolic disease, acquired disturbances of colour vision, subarachnoid hemorrhage, age < 15 yr |
| ulipristal acetate (Fibristal®) | Selective progesterone receptor modulator (SPRM) | 5 mg PO OD for max 3 mc; first tablet taken anytime during first 7 days of menstruation | Leiomyoma (pre-operative) | S/E: headache, hot flushes, constipation, vertigo, endometrial thickening  
 C/I: pregnancy, undiagnosed vaginal bleeding, any gyna cancer |
| urofollitropin (Metrodin®) | FSH | 75 IU SC x 7-12d | Ovulation induction in PCOS | S/E: ovarian enlargement or cysts, edema and pain at injection site, arterial thromboembolism, fever, abdominal pain, headache, multiple pregnancy  
 C/I: primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, undiagnosed uterine bleeding |
| combined oral contraceptive pill (OCP) | Ovulatory suppression by inhibiting LH and FSH  
 Decidualization of endometrium  
 Thickening of cervical mucus to prevent sperm penetration | | Contraception Disorders of menstruation | See Tables 8-12 |
| intrauterine device (IUD) | Copper IUD; mild foreign body reaction in endometrium which is toxic to sperm and alters sperm motility  
 Progesterone-releasing IUD: decidualization of endometrium and thickening of cervical mucus, may suppress ovulation | | Contraceptive effects last 3 yrs (Jaydess); up to 5 yr (Copper IUD, Mirena) | Same as above See Table 8-12 |

HB - hemoglobin  
Hct - hematocrit  
H2 - Hematology Toronto Notes 2017

**Basics of Hematology**

- Over $10^{11}$ blood cells are produced daily.  
- Sites of hematopoiesis in adults: pelvis, sternum, vertebral bodies, cranium.  
- Lifespan of mature cells in blood:  
  - Erythrocytes (90-120 d), neutrophils (~1 d), platelets (7-10 d), lymphocytes (varies – memory cells persist for years).  
- Role of lymphoid organs:  
  - Spleen: part of reticuloendothelial system, sequesters aged RBCs, removes opsonized cells, site of antibody production.  
  - Thymus: site of T-cell maturation, involutes with age.  
  - Lymph nodes: sites of B and T-cell activation (adaptive immune response).
### Complete Blood Count

#### Table 1. Common Terms Found in the CBC

<table>
<thead>
<tr>
<th>Test</th>
<th>Definition</th>
<th>Normal Values*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red Blood Cell (RBC) Count</td>
<td>The number of RBCs per volume of blood</td>
<td>4.2-6.9 x 10⁶/mm³</td>
</tr>
<tr>
<td>Hemoglobin (Hb)</td>
<td>Amount of oxygen-carrying protein in the blood</td>
<td>130-180 g/L (male)</td>
</tr>
<tr>
<td>Hematocrit (Hct)</td>
<td>Percentage of a given volume of whole blood occupied by packed RBCs</td>
<td>45%-62% (male)</td>
</tr>
<tr>
<td>Mean Corpuscular Volume (MCV)</td>
<td>Measurement of RBC size</td>
<td>60-100 µm³</td>
</tr>
<tr>
<td>Mean Corpuscular Hb (MCH)</td>
<td>Amount of oxygen-carrying Hb inside RBCs</td>
<td>27-32 pg/cell</td>
</tr>
<tr>
<td>White Blood Cell (WBC) Count</td>
<td>The number of WBCs per volume of blood</td>
<td>4.3-10.8 x 10⁹/mm³</td>
</tr>
<tr>
<td>WBC Differential</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Neutrophils</td>
<td></td>
<td>1.8-3.8 x 10⁹/mm³</td>
</tr>
<tr>
<td>- Lymphocytes</td>
<td></td>
<td>0.7-4.5 x 10⁹/mm³</td>
</tr>
<tr>
<td>- Monocytes</td>
<td></td>
<td>0.1-1.0 x 10⁹/mm³</td>
</tr>
<tr>
<td>- Eosinophils</td>
<td></td>
<td>0.0-0.4 x 10⁹/mm³</td>
</tr>
<tr>
<td>- Basophils</td>
<td></td>
<td>0.0-0.2 x 10⁹/mm³</td>
</tr>
<tr>
<td>Platelet Count</td>
<td>The number of platelets per volume of blood</td>
<td>150-400 x 10³/mm³</td>
</tr>
<tr>
<td>Mean Platelet Volume (MPV)</td>
<td>Measurement of platelet size</td>
<td></td>
</tr>
<tr>
<td>Reticulocytes</td>
<td>Immature RBCs that contain no nucleus but have residual RNA</td>
<td>Normally make up 1% of total RBC count</td>
</tr>
</tbody>
</table>

*I-normal values may vary depending on site and age

---

### Approach to Interpreting a CBC

1. consider values in the context of individual's baseline
2. is one cell line affected or are several?
   - if all lines are low: pancytopenia (see Pancytopenia, H8)
   - if RBCs and platelets are low: consider a MAHA/TMA (see Microangiopathic Hemolytic Anemia/Thrombotic Microangiopathy, H22)
   - if single cell line affected: see Common Presenting Problems, H6

---

### Blood Film Interpretation

#### RED BLOOD CELLS

**Size**
- microcytic (MCV <80 µm³), normocytic (MCV = 80-100 µm³), macrocytic (MCV >100 µm³)
- anisocytosis: RBCs with increased variability in size (increased RDW)
  - iron deficiency anemia, hemolytic anemias, myelofibrosis, blood transfusion, MDS

**Colour**
- hypochromic: increase in size of central pallor (normal = less than 1/3 of RBC diameter)
  - iron deficiency anemia, anemia of chronic disease, sideroblastic anemia
- polychromasia: increased reticulocytes (pinkish-blue cells)
  - increased RBC production by bone marrow

**Shape**
- poikilocytosis: increased proportion of RBCs of abnormal shape
  - iron deficiency anemia, myelofibrosis, severe B12 deficiency, MDS, burns
### Table 2. Common Erythrocyte Shapes

<table>
<thead>
<tr>
<th>Shape</th>
<th>Definition</th>
<th>Associated Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discocyte</td>
<td>Biconcave disc</td>
<td>Normal RBC</td>
</tr>
<tr>
<td>Spherocyte</td>
<td>Spherical RBC (due to loss of membrane)</td>
<td>Hereditary spherocytosis, immune hemolytic anemia, post-transfusion</td>
</tr>
<tr>
<td>Elliptocyte/Ovalocyte</td>
<td>Oval-shaped, elongated RBCs</td>
<td>Hereditary elliptocytosis, megaloblastic anemia, myelofibrosis, iron-deficiency, MDS (myelodysplastic syndrome)</td>
</tr>
<tr>
<td>Schistocyte (helmet cell, fragment)</td>
<td>Fragmented cells (due to traumatic disruption of membrane)</td>
<td>Microangiopathic hemolytic anemia (HUS, aHUS, TTP, DIC, preeclampsia, HELLP, malignant HTN, vasculitis, glomerulonephritis, prosthetic heart valve)</td>
</tr>
<tr>
<td>Sickle Cell</td>
<td>Sickle-shaped RBC (due to polymerization of hemoglobin)</td>
<td>Sickle cell disorders: HbSC, HbSS</td>
</tr>
<tr>
<td>Codocyte (target cell)</td>
<td>“Bul’s eye” on dried film</td>
<td>Liver disease, hemoglobin SC, thalassemia, iron deficiency, asplenia</td>
</tr>
<tr>
<td>Dacrocyte (teardrop cell)</td>
<td>Single pointed end, looks like a teardrop</td>
<td>Myelofibrosis, thalassemia major, megaloblastic anemia, bone marrow infiltration</td>
</tr>
<tr>
<td>Acanthocyte (spur cell)</td>
<td>Distorted RBC with irregularly distributed thorn-like projections (due to abnormal membrane lipids)</td>
<td>Severe liver disease (spur cell anemia), starvation/anorexia, post-splenectomy</td>
</tr>
<tr>
<td>Echinocyte (burr cell)</td>
<td>RBC with numerous regularly spaced, small spiny projections</td>
<td>Uremia, HUS, burns, cardiopulmonary bypass, post-transfusion, storage artifact</td>
</tr>
<tr>
<td>Rouleaux Formation</td>
<td>Aggregates of RBC resembling stacks of coins (due to increased plasma concentration of high molecular weight proteins)</td>
<td>Pregnancy is most common cause (due to physiological increase in fibrinogen) Inflammatory conditions (due to polyclonal immunoglobulins) Plasma cell dyscrasias (due to monoclonal paraproteinemia, e.g. multiple myeloma, macroglobulinemia) Storage artifact</td>
</tr>
</tbody>
</table>

DIC = disseminated intravascular coagulation; HUS = hemolytic uremic syndrome; aHUS = atypical HUS; TTP = thrombotic thrombocytopenic purpura
Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

### Table 3. RBC Inclusions

<table>
<thead>
<tr>
<th>Inclusions</th>
<th>Definition</th>
<th>Associated Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nucleus</td>
<td>Present in erythroblasts (immature RBCs)</td>
<td>Hyperplastic erythropoiesis (seen in hypoxia, hemolytic anemia), BM infiltration disorders, MPPs (MF)</td>
</tr>
<tr>
<td>Heinz Bodies</td>
<td>Denatured and precipitated hemoglobin</td>
<td>G6PD deficiency (post-exposure to oxidant), thalassemia, unstable hemoglobins</td>
</tr>
<tr>
<td>Howell-Jolly Bodies</td>
<td>Small nuclear remnant resembling a pyknotic nucleus</td>
<td>Post-splenectomy, hyposplenism (sickle cell disease), neonates, megaloblastic anemia</td>
</tr>
<tr>
<td>Basophilic Stippling</td>
<td>Deep blue granulations indicating ribosome aggregation</td>
<td>Thalassemia, heavy metal (Pb, Zn, Ag, Hg) poisoning, megaloblastic anemia, hereditary (pyrimidine 5’nucleotidase deficiency)</td>
</tr>
<tr>
<td>Sideroblasts</td>
<td>Erythrocytes with Fe containing granules in the cytoplasm</td>
<td>Hereditary, idiopathic, drugs, hypothyroidism (see Sideroblastic Anemia, H16), myelodysplastic syndrome, toxins (lead)</td>
</tr>
</tbody>
</table>

BM = bone marrow; MF = myelofibrosis; MPP = myeloproliferative neoplasm
Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012
**WHITE BLOOD CELLS**
- lymphocytes: comprise 30–40% of WBCs; great variation in "normal" lymphocyte morphology
- neutrophils
  - normally, only mature neutrophils (with 3–4 lobed nucleus) and band neutrophils (immediate precursor with horseshoe-shaped nucleus) are found in circulation
  - hypersegmented neutrophil: >5 lobes suggests megaloblastic process (B12 or folate deficiency)
- left shift (increased granulocyte precursors)
  - seen in leukemoid reactions: acute infections, pregnancy, neonates, hypoxia, shock, myeloproliferative neoplasms (CML, MF)
- blasts
  - immature, undifferentiated precursors; associated with acute leukemia, MDS, G-CSF (growth factor that stimulates neutrophil production) use

This is a MEDICAL EMERGENCY

**Table 4. Abnormal White Blood Cells on Film**

<table>
<thead>
<tr>
<th>Appearance</th>
<th>Definition</th>
<th>Associated Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reed-Sternberg Cell</td>
<td>Giant, multinucleated B-lymphocyte, (classic ‘owl-eye’ morphology)</td>
<td>Primarily Hodgkin lymphoma, also seen in some non-Hodgkin lymphoma, CLL, and EBV infection</td>
</tr>
<tr>
<td>Smudge Cell</td>
<td>Lymphocytes damaged during blood film preparation indicating cell fragility</td>
<td>CLL and other lymphoproliferative disorders Pathognomonic in EBV infection</td>
</tr>
<tr>
<td>Auer Rod</td>
<td>Cytoplasmic inclusions that form long needles in the cytoplasm of myeloblasts</td>
<td>Pathognomonic for acute myeloid leukemia (AML)</td>
</tr>
<tr>
<td>Atypical Lymphocyte</td>
<td>Pale blue cytoplasm following RBC edges with pink granules</td>
<td>Viruses (particularly EBV) T-cell large granular lymphocyte leukemia (T-LGL)</td>
</tr>
</tbody>
</table>

EBV = Epstein-Barr virus , CLL = chronic lymphocytic leukemia
Illustrations: Ayalah Hutchins and Merry Shiyu Wang 2012

**PLATELETS**
- small, purple, anuclear cell fragments

**Bone Marrow Aspiration and Biopsy**
- sites: posterior iliac crest, sternum
- analyses: most often done together
  - aspiration: takes a fluid marrow sample for cellular morphology, flow cytometry, cytogenetics, molecular studies, microbiology (C&S, acid-fast bacilli, PCR)
  - note: differential diagnosis for a “dry tap”: MF, hairy cell leukemia, bone marrow infiltration
  - biopsy: takes a sample of intact bone marrow to assess histology (architecture) and immunohistochemistry

**Indications**
- unexplained CBC abnormalities
- diagnosis and evaluation of infiltrating cancers: plasma cell disorders, leukemias, solid tumours
- diagnosis and staging of lymphoma or solid tumours
- evaluate iron metabolism and stores (gold standard, but rarely done)
- evaluate suspected deposition and storage disease (e.g. amyloidosis, Gaucher’s disease)
- evaluate fever of unknown origin, suspected mycobacterial, fungal/parasitic infections, or granulomatous disease
- evaluate unexplained splenomegaly
- confirm normal bone marrow in potential allogenic hematopoietic cell donor

**Important Considerations:**
- consult a hematologist prior to conducting a bone marrow biopsy on a patient with an inherited (e.g. hemophilia, VWF disease) or acquired (e.g. DIC, anticoagulant therapy, coagulopathy of liver disease, severe thrombocytopenia) bleeding diathesis to determine if pro-hemostatic therapy is indicated pre-procedure
- do not perform a bone marrow biopsy if there is evidence of infection over the targeted skin site
Common Presenting Problems

Anemia

Definition
- a decrease in red blood cell (RBC) mass that can be detected by hemoglobin (Hb) concentration, hematocrit (Hct), and RBC count
  - adult males: Hb <130 g/L or Hct <0.41
  - adult females: Hb <120 g/L or Hct <0.36 (changes with pregnancy and trimester)

Clinical Features
- symptoms of anemia: fatigue, headache, light-headedness, malaise, weakness, decreased exercise tolerance, dyspnea, palpitations, dizziness, tinnitus, syncope
- acute vs. chronic, bleeding, systemic illness, diet (Fe, B12 sources), alcohol, family history
- menstrual history: menorrhagia, menometrorrhagia
- rule out pancytopenia (recurrent infection, mucosal bleeding, easy bruising)
- physical signs
  - HEENT: pallor in mucous membranes and conjunctiva at Hb <90 g/L (<9 g/dL), ocular bruits at Hb <35 g/L (<5.5 g/dL), angular chelosis, jaundice
  - cardiac: tachycardia, orthostatic hypotension, systolic flow murmur, wide pulse pressure, signs of CHF
dermatologic: ecchymosis, petechiae, pallor in palmar skin creases at Hb <75 g/L, jaundice (if due to hemolysis), nail changes (spooning), glossitis
  - splenomegaly, lymphadenopathy

Investigations
- rule out dilutional anemia (low Hb due to increased effective circulating volume)
- CBC with differential
- reticulocyte count and blood smear/film
- rule out nutritional deficit, gastrointestinal and genitourinary disease in iron deficiency anemia
- additional laboratory investigations as indicated (see Microcytic Anemia, H13, Normocytic Anemia, H17, Hemolytic Anemia, H18, and Macrocytic Anemia, H23)
- N.B. may have a mixed picture with multiple concomitant nutritional deficiencies

Erythrocytosis

Definition
- an increase in the number of RBCs: Hb >185 g/L or Hct >52% (males); Hb >165 or Hct >47% (females and African males)

Etiology
- relative/spurious erythrocytosis (decreased plasma volume): diuretics, severe dehydration, burns, “stress” (Gaisböck’s syndrome)
- absolute erythrocytosis
### Table 5. Etiology of Erythrocytosis

<table>
<thead>
<tr>

<tr>
<td></td>
<td></td>
<td>Exogenous erythropoietin</td>
</tr>
</tbody>
</table>

#### Clinical Features
- secondary to high red cell mass and hyperviscosity
  - headache, dyspnea, dizziness, tinnitus, visual disturbances, hypertensive symptoms, numbness/tingling
  - symptoms of angina, congestive heart failure, aquagenic pruritus (only in MPNs)
- thrombosis (venous or arterial) or bleeding (seen with acquired vWD or acquired platelet dysfunction in MPNs)
- physical findings
  - splenomegaly ± hepatomegaly, facial plethora/ruddy complexion (70%) and/or palms, gout

#### Investigations
- serum erythropoietin (EPO): differentiates primary (low/normal) from other etiologies (elevated)
  - search for tumour as source of EPO as indicated (e.g. abdominal U/S, CT head)
  - JAK-2 mutation analysis: positive in >96% of cases of PV
  - only send if low/normal EPO level
- ferritin (iron deficiency can mask the diagnosis; if iron deficient with reticulocytosis, suggestive of PV)

#### Treatment
- if primary: see Polycythemia Vera, H41
- if secondary: treat underlying cause
  - O₂ for hypoxemia, CPAP for sleep apnea, surgery for EPO-secreting tumours
  - often cardiologists will be hesitant to treat high Hct in cyanotic patients

---

### Thrombocytopenia

#### Definition
- platelet count <150 x10⁹/L

#### Clinical Features
- history: mucocutaneous bleeding (easy bruising, gingival bleeding), epistaxis, peri-operative bleeding (including dental procedures), heavy menstrual bleeding, peripartum bleeding
  - physical exam: bruising, petechiae, ecchymoses, non-palpable purpura, wet purpura
  - see Disorders of Primary Hemostasis, H27 for complications

#### Investigations
- CBC and differential
- blood film
  - rule out pseudo-thrombocytopenia (platelet clumping or platelet satellitism)
  - decreased production: other cell line abnormalities, blasts, hypersegmented PMNs, leukoerythroblastic changes
  - increased destruction: large platelets (often seen in ITP), schistocytes (seen in MAHA/TMA)
  - workup for nutritional deficiencies: B₁₂, RBC folate
  - PT/INR, aPTT and fibrinogen if DIC suspected
  - LFTs

#### Treatments
- life threatening bleeding: platelet transfusion (repeat CBC 1 h post-transfusion to confirm an appropriate rise in counts)
- if secondary: treat underlying cause
  - ITP: see Immune Thrombocytopenic Purpura, H27
**Thrombocytopenia**

**Definition**
- platelet count >400 x10^9/L
- primary thrombocytosis (uncommon): due to myeloproliferative neoplasms (e.g. CML, polycythemia vera, primary myelofibrosis, essential thrombocytosis; rarely associated with MDS)
- reactive/secondary thrombocytosis (common): acute phase reactant (e.g. surgery, inflammation, infection, trauma, bleeding, iron deficiency, neoplasms, ischemic injury)

**Clinical Features**
- history: trauma, surgery, splenectomy, infection, inflammation, bleeding, iron deficiency, prior diagnosis of chronic hemolytic disorder, constitutional symptoms (malignancy)
- vasomotor symptoms: headache, visual disturbances, lightheadedness, atypical chest pain, acral dysesthesia, erythromelalgia, livedo reticularis, aquagenic pruritus
- clotting risk, bleeding risk (rare)
- physical exam: splenomegaly can be seen in myeloproliferative neoplasms (MPNs)

**Investigations**
- CBC, peripheral blood film, serum ferritin concentration
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MPN/MDS

**Treatment**
- primary: ASA ± cytoreductive agents (e.g. hydroxyurea, anagrelide, interferon-α)
- secondary: treat underlying cause

---

**Pancytopenia**

**Definition**
- a decrease in all hematopoietic cell lines

**Clinical Features**
- anemia: fatigue (see Anemia, H6)
- leukopenia: recurrent infections (see Neutropenia, H9)
- thrombocytopenia: mucosal bleeding (see Thrombocytopenia, H7)

**Investigations**
- CBC, peripheral blood film, serum ferritin concentration, B12, folate
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- work up as per Figure 4 and presenting symptoms/physical exam
- if reactive process has been ruled out, bone marrow biopsy may be required

*In hospitalized patients most common causes of thrombocytopenia are drugs and infection*

**Figure 3. Approach to thrombocytopenia**

Neutrophilia

Definition
- variable definition, but generally an absolute neutrophil count (ANC) $>7.7 \times 10^9/L$ (WHO definition)

Etiology
- primary neutrophilia
  - chronic myeloid leukemia (CML)
  - other myeloproliferative disorders: PV, ET, myelofibrosis
  - hereditary neutrophilia (autosomal dominant)
  - chronic idiopathic neutrophilia in otherwise healthy patients
  - leukocyte adhesion deficiency
- secondary neutrophilia
  - stress/exercise/epinephrine: movement of neutrophils from marginated pool into circulating pool
  - obesity
  - infection: leukocytosis with left shift ± toxic granulation, Döhle bodies (intra-cytoplasmic structures composed of agglutinated ribosomes)
  - inflammation: e.g. rheumatoid arthritis (RA), IBD, chronic hepatitis, MI, PE, burns
  - malignancy: hematologic (i.e. marrow invasion by tumour) and non-hematologic (especially large cell lung cancer)
  - medications: glucocorticoids, β-agonists, lithium, G-CSF

Clinical Features
- look for signs and symptoms of fever, inflammation, malignancy to determine appropriate further investigations
  - including lymphadenopathy and organomegaly
- examine oral cavity, teeth, peri-rectal area, genitals, and skin for signs of infection

Investigations
- CBC and differential: mature neutrophils or bands $>20\%$ of total WBC suggests infection/inflammation
- blood film: Döhle bodies, toxic granulation, cytoplasmic vacuoles in infection
- may require bone marrow biopsy if MPN suspected

Treatment
- directed at underlying cause

Neutropenia

Definition
- mild: ANC $1.0-1.5 \times 10^9/L$
- moderate: ANC $0.5-1.0 \times 10^9/L$ (risk of infection starts to increase)
- severe: ANC $<0.5 \times 10^9/L$
- profound: ANC $<0.1 \times 10^9/L$ for $>7$ d

Absolute Neutrophil Count (ANC) = WBC count x (%PMNs + %bands)
Beware of fever + ANC $<0.5 \times 10^9/L = \text{FEBRILE NEUTROPENIA}$
Etiology

Table 6. Etiology of Neutropenia

</tbody>
</table>

Clinical Features

- fever, chills (only if infection present)
- infection by endogenous bacteria (e.g. S. aureus, gram negatives from GI and GU tract)
- painful ulceration on skin, anus, mouth, and throat following colonization by opportunistic organisms
- avoid digital rectal exam

Investigations

- dependent on degree of neutropenia, history, and symptoms
- ranges from observation with frequent CBCs to bone marrow aspiration and biopsy

Treatment

- regular dental care: chronic gingivitis and recurrent stomatitis major sources of morbidity
- treatment of febrile neutropenia (see Infectious Diseases, ID45)
- in severe immune-mediated neutropenia, G-CSF may increase neutrophil counts
- if no response to G-CSF, consider immunosuppression (e.g. steroids, cyclosporine, methotrexate)

**Lymphocytosis**

Definition

- absolute lymphocyte count >4.0 x 10⁹/L

Etiology

- infection (reactive lymphocytosis)
  - viral infections (majority); particularly mononucleosis
  - TB, pertussis, brucellosis, toxoplasmosis
  - smoking
  - physiologic response to stress (e.g. trauma, status epilepticus)
  - hypersensitivity (e.g. drugs, serum sickness)
  - autoimmune (e.g. rheumatoid arthritis)
  - neoplasm (e.g. ALL if blasts present, CLL, B cell lymphocytosis of undetermined significance)

Investigations

- CBC, peripheral smear assessing lymphocyte morphology

Treatment

- treat underlying cause
**Lymphopenia**

**Definition**
- absolute lymphocyte count <1.0 x 10^9/L

**Etiology**
- idiopathic CD4+ lymphocytopenia
- radiation
- HIV/AIDS, hepatitis B, hepatitis C
- malignancy/chemotherapeutic agents
- malnutrition, alcoholism
- autoimmune disease (e.g. SLE)

**Clinical Features**
- opportunistic infections (see Infectious Diseases, ID34)

**Treatment**
- treat underlying cause
- treat opportunistic infections aggressively and consider antimicrobial prophylaxis (see Infectious Diseases, ID30)

---

**Eosinophilia**

**Definition**
- absolute eosinophil count >0.5 x 10^9/L

**Etiology**
- primary: due to clonal bone marrow disorder
  - if no primary etiology identified, classified as hypereosinophilic syndrome
    - 6 mo of eosinophilia (count >1.5 x 10^9/L) with no other detectable causes and end organ damage
    - can involve heart, bone marrow, CNS
- secondary
  - most common causes are parasitic (usually helminth) infections and allergic reactions
  - less common causes
    - collagen vascular diseases (e.g. RA, polyarteritis nodosa, see Rheumatology, RH19)
    - respiratory causes (asthma, eosinophilic pneumonia, Churg-Strauss)
    - cholesterol emboli
    - hematologic malignancy: see Chronic Myeloid Leukemia, H40 and Hodgkin Lymphoma, H45
    - adrenal insufficiency, see Endocrinology, E33
    - medications (penicillins)
    - atopic dermatitis

**Treatment**
- treat underlying cause
- ensure strongyloides serology is collected to rule out infection before initiating steroids for patients at risk

---

**Agranulocytosis**

**Definition**
- severe depletion of granulocytes (neutrophils, eosinophils, basophils) from the blood and granulocyte precursors from bone marrow

**Etiology**
- associated with medications in 70% of cases: e.g. chemotherapy, clozapine, thionamides (antithyroid drugs), sulfasalazine, and ticlopidine
  - immune-mediated destruction of circulating granulocytes by drug-induced antibodies or direct toxic effects upon marrow granulocytic precursors

**Clinical Features**
- abrupt onset of fever, chills, weakness, and oropharyngeal ulcers

**Prognosis**
- high fatality without vigorous treatment

**Investigations/Treatment**
- discontinue offending drug
- pan-culture and screen for infection if patient is febrile (blood cultures x2, urine culture, and chest x-ray as minimum, initiate broad-spectrum antibiotics)
- consider bone marrow aspirate and biopsy if cause unclear
- consider G-CSF
Leukemoid Reaction

- blood findings resembling those seen in certain types of leukemia which reflect the response of healthy BM to cytokines released due to infection or trauma
- leukocytosis >50 x 10^9/L, marked left shift (myelocytes, metamyelocytes, bands in peripheral blood smear)

Approach to Lymphadenopathy

History

- constitutional/B-symptoms: seen in TB, lymphoma, other malignancies
- growth pattern: acute vs. chronic
- exposures: cats (cat scratch – Bartonella henselae), ticks (Lyme disease – Borrelia burgdorferi), high risk behaviours (HIV)
- joint pain/swelling, rashes (connective tissue disorder)
- pruriitus (seen in Hodgkin lymphoma)
- medications (can cause serum sickness – lymphadenopathy)

Clinical Features

- determine if lymphadenopathy is localized or generalized
- localized: typically reactive or neoplastic
  - cervical (bacterial/mycobacterial infections, ENT malignancies, metastatic cancer)
  - supravacular
    - right (mediastinal, bronchogenic, esophageal cancer)
    - left (gastric, gall bladder, pancreas, renal, testicular/orvian cancer)
  - axillary (cat scratch fever, breast cancer, metastatic cancer)
  - epitrochlear (infections, sarcoidosis, lymphoma)
- check for splenomegalgy, constitutional symptoms

Investigations

- CBC and differential, blood film
- if generalized, consider tuberculin test, HIV RNA, VDRL, Monospot®/EBV serology, ANA, imaging
- if localized and no symptoms suggestive of malignancy, can observe 3-4 wk (if no resolution – biopsy)
- excisional biopsy is preferred as it preserves node architecture (essential for diagnosing lymphoma)
- in areas difficult to access (retroperitoneal, mediastinal/hilar) multiple core biopsies may be more practical/feasible
- FNA should NOT be used for diagnostic purposes in lymphoproliferative disease (use excisional biopsy instead)
  - FNA is helpful for recurrence of solid tumour malignancy
  - imaging such as U/S or CT can provide more info, but generally adds little to diagnosis

Table 7. Inflammatory vs. Neoplastic Lymph Nodes

<table>
<thead>
<tr>
<th>Feature</th>
<th>Inflammatory</th>

</tbody>
</table>

The underlined conditions cause massive splenomegaly (spleen crosses midline or reaches pelvis).

History
- constitutional symptoms, feeling of fullness in LUQ, early satiety
- signs or symptoms of infection (e.g. mononucleosis) or malignancy
- history of liver disease, hemolytic anemia, or high-risk exposures

Clinical Features
- jaundice, petechiae
- signs of chronic liver disease
- percussion (Castell's sign, Traube's space, Nixon's method) and palpation
- associated lymphadenopathy or hepatomegaly
- signs of CHF

Investigations
- CBC and differential, blood film
- as indicated: liver enzymes (AST, ALT, ALP, GGT) and/or LFTs (platelet, INR, albumin, bilirubin), reticulocyte count, Monospot®/EBV, haptoglobin, LDH, infectious, and autoimmune workup
- imaging
  - ultrasound of abdomen/liver to assess for cirrhosis and portal vein thrombosis (if positive, refer to hepatology for evaluation)
  - echo for cardiac function
  - CT to rule out lymphoma and assess splenic lesions

Microcytic Anemia

- MCV <80 fl
- see Figure 2, Approach to Anemia, H6

Iron Metabolism

Iron Intake (Dietary)
- average North American adult diet = 10-20 mg iron (Fe) daily
- steady state absorption is 5-10% (0.5-2 mg/d); enhanced by citric acid, ascorbic acid (vitamin C) and reduced by polyphenols (e.g. in tea), phytate (e.g. in bran), dietary calcium, and soy protein
- males have positive Fe balance; up to 20% of menstruating females have negative Fe balance
Iron Absorption and Transport
- Dietary iron is absorbed in the duodenum (e.g., absorption impaired in IBD and Celiac disease)
- In circulation, the majority of non-heme iron is bound to transferrin, which transfers iron from enterocytes and storage pool sites (macrophages of the reticuloendothelial system and hepatocytes) to RBC precursors in the bone marrow.

Iron Levels
- Hepcidin is a hormone produced by hepatocytes that regulates systemic iron levels.
  - Binds to iron exporter ferroportin (on duodenal enterocytes and reticuloendothelial cells) and induces its degradation, thereby inhibiting iron export into circulation (diminished absorption of iron and iron trapping in reticuloendothelial system cells).
  - Hepcidin production is:
    ■ Increased in states of iron overload (inhibiting additional iron absorption) and inflammation (mediating anemia of chronic inflammation through iron trapping).
    ■ Decreased in states where erythropoiesis is increased (e.g., hemolysis) or oxygen tension is low.

Iron Storage
- Ferritin
  ■ Ferric iron (Fe$^{3+}$) complexed to a protein called apoferritin (hepatocytes are main ferritin storage site).
  ■ Small quantities are present in plasma in equilibrium with intracellular ferritin.
  ■ Also an acute phase reactant – can be spuriously elevated despite low Fe stores in response to a stressor.
- Hemosiderin
  ■ Aggregates or crystals of ferritin with the apoferritin partially removed.
  ■ Macrophage-monocyte system is main source of hemosiderin storage.

Iron Indices
- Bone marrow aspirate: Gold standard test for assessment of iron stores (rarely done).
- Serum ferritin: Most important blood test for iron stores.
  ■ Decreased in iron deficiency anemia.
  ■ Elevated in infection, inflammation, malignancy, liver disease, hyperthyroidism, and iron overload.
- Serum iron: Measure of all non-heme iron present in blood.
  ■ Varies significantly daily.
  ■ Virtually all serum iron is bound to transferrin, only a trace is free or complexed in ferritin.
- Total iron binding capacity (TIBC): Total amount of transferrin present in blood.
  ■ Normally, one third of TIBC is saturated with iron.
  ■ High specificity for decreased iron, low sensitivity.
- Saturation
  ■ Serum Fe divided by TIBC, expressed as a proportion or a percentage.
- Soluble transferrin receptor (sTfR)
  ■ Reflects the availability of iron at the tissue level.
  ■ The transferrin receptor is expressed on the surface of erythroblasts and is responsible for iron uptake – some is cleaved off and is present in circulation as sTfR.
  ■ In iron deficient states more transferrin receptor is expressed on erythroblasts leading to an increase in sTfR.
  ■ Low in reduced erythropoiesis and iron overload.
  ■ Useful in determining iron deficiency in the setting of chronic inflammatory disorders (see Iron Deficiency Anemia).
Iron Deficiency Anemia

- see Pediatrics, P45
- most common cause of anemia in North America

Etiology
- increased demand
  - increased physiological need for iron in the body (e.g. pregnancy)
  - decreased supply: dietary deficiencies (rarely the only etiology in the developed world)
  - cow’s milk (infant diet), “tea and toast” diet (elderly), absorption imbalances, post-gastrectomy, malabsorption (IBD of duodenum, celiac disease, autoimmune atrophic gastritis, H. pylori infection)
- increased losses
  - hemorrhage
    - obvious causes: menorrhagia, abnormal uterine bleeding, frank GI bleed
    - occult: peptic ulcer disease, GI cancer
  - hemolysis
    - chronic intravascular hemolysis (e.g. PNH, cardiac valve RBC fragmentation)
- most common cause of anemia in North America

Clinical Features
- iron deficiency may cause fatigue before clinical anemia develops
- signs/symptoms of anemia: see Anemia, H6
- brittle hair, nail changes (brittle, koilonychia)
- pica (appetite for non-food substances e.g. ice, paint, dirt)
- restless leg syndrome

Investigations
- iron indices, including soluble transferrin receptor
  - low ferritin (<18 µg/L) is diagnostic of iron deficiency
  - ferritin is an acute phase reactant and is elevated in the setting of inflammatory conditions and liver disease; serum ferritin <100 µg/L in these settings is suggestive of iron deficiency, necessitating further workup
- peripheral blood film
  - hypochromic microcytosis: RBCs have low Hb levels due to lack of iron
  - pencil forms, anisocytosis
  - target cells
- bone marrow (gold standard but rarely done)
  - iron stain (Prussian blue) shows decreased iron in macrophages and in erythroid precursors (sideroblasts)
  - intermediate and late erythroblasts show micrornormoblastic maturation

Treatment
- treat underlying cause
- supplementation
  - oral (capsules, syrup)
    - ferrous sulphate 325 mg tid (65 mg elemental iron), ferrous gluconate 300 mg tid (35 mg elemental iron), or ferrous fumarate 300 mg tid (100 mg elemental iron)
    - supplement until anemia corrects, then continue for 3+ mo until serum ferritin returns to normal
    - oral iron should be taken with citrus juice (vitamin C) to enhance absorption
  - IV (iron sucrose or dextran) can be used if patient cannot tolerate or absorb oral iron
- monitoring response
  - reticulocyte count will begin to increase after one wk
  - Hb normalizes by 10 g/L per wk (if no blood loss)

Figure 6. Approach to interpreting iron indices
Adapted from: Am Fam Physician 2001;74:671-678
**Anemia of Chronic Inflammation**

**Etiology**
- infection, malignancy, inflammatory and rheumatologic disease, chronic renal and liver disease, endocrine disorders (e.g. DM, hypothyroidism, hypogonadism, hypopituitarism)

**Pathophysiology**
- an anemia of underproduction due to impaired iron utilization (hepcidin is a key regulatory peptide)
  - hepatic hepcidin production is increased in inflammatory processes, trapping iron in enterocytes and macrophages (via ferroportin inhibition) (see Figure 5)
  - reduced plasma iron levels make iron relatively unavailable for new hemoglobin synthesis
  - marrow unresponsive to normal or slightly elevated EPO
- mild hemolytic component is often present i.e. RBC survival is modestly decreased

**Investigations**
- diagnosis of exclusion
- associated with elevation in acute phase reactants (ESR, CRP, fibrinogen, platelets)
- peripheral blood
  - mild: usually normocytic and normochromic
  - moderate: may be microcytic and normochromic
  - severe: may be microcytic and hypochromic
  - absolute reticulocyte count is frequently low, reflecting overall decrease in RBC production
- “classic” serum iron indices
  - serum iron and TIBC low, % saturation low
  - serum ferritin is normal or increased
- bone marrow
  - normal or increased iron stores
  - decreased or absent staining for iron in erythroid precursors

**Treatment**
- treat underlying disease
- only treat anemia in patients who can benefit from a higher hemoglobin
- IV iron if no benefit from PO iron (overcomes sequestration in enterocytes)
- erythropoietin indicated in chronic renal failure; not to be used if patient has concomitant curative solid tumour malignancy; ensure Hb target <110 g/L

---

**Sideroblastic Anemia**

**Sideroblasts**
- erythrocytes with iron-containing (basophilic) granules in the cytoplasm
- "normal": in healthy individuals, granules are small and randomly spread in the cytoplasm
- "ring": iron deposits in mitochondria, forming large, abnormal granules that surround the nucleus
  - the hallmark of sideroblastic anemia

**Etiology**
- due to defects in heme biosynthesis in erythroid precursors
- hereditary (rare): X-linked; median survival 10 yr
- idiopathic (acquired)
  - refractory anemia with ringed sideroblasts: a subtype of MDS (see Myelodysplastic Syndromes, H39)
  - may be a preleukemic phenomenon (10% transform to AML)
- reversible
  - drugs (isoniazid, chloramphenicol), alcohol, lead, copper deficiency, zinc toxicity, hypothyroidism

**Clinical Features**
- anemia symptoms (see Anemia, H6)
- hepatosplenomegaly, evidence of iron overload

**Investigations**
- serum iron indices
  - increased serum Fe²⁺, normal TIBC, increased ferritin, increased sTfR
- blood film/bone marrow biopsy
  - ringed sideroblasts (diagnostic hallmark)
  - RBCs are hypochromic; can be micro-, normo-, or macrocytic
  - anisocytosis, poikilocytosis, basophilic stippling
**Normocytic Anemia**

- MCV 80-100 fL
- see Figure 2, *Approach to Anemia*, H6

**Aplastic Anemia**

**Definition**
- destruction of hematopoietic cells of the bone marrow leading to pancytopenia and hypocellular bone marrow

**Etiology**

<table>
<thead>
<tr>
<th>Congenital</th>
<th>Acquired</th>

</tbody>
</table>

**Clinical Features**
- can present acutely or insidiously
- symptoms of anemia (see Anemia, H6), thrombocytopenia (see Thrombocytopenia, H7), and/or infection
- ± splenomegaly and lymphadenopathy (depending on the cause)

**Investigations**
- exclude other causes of pancytopenia (see Figure 4), including PNH (overlap syndrome)
- CBC
  - anemia or neutropenia or thrombocytopenia (any combination) ± pancytopenia
  - decreased reticulocytes (<1% of the total RBC count)
- blood film
  - decreased number of normal RBCs
- bone marrow
  - aplasia or hypoplasia of marrow cells with fat replacement
  - decreased cellularity

**Treatment**
- remove offending agents
- supportive care (red cell and platelet transfusions, antibiotics)
- judicious use so as to not increase the risk of immune sensitization to blood products
- immunosuppression (for idiopathic aplastic anemia)
- anti-thymocyte globulin: 50-60% of patients respond
- cyclosporine
- allogenic bone marrow transplant
- growth factors: e.g. Eltrombopag (TPO receptor agonist), G-CSF and EPO not effective

---

**Lead Poisoning**

**Definition/Etiology**
- blood lead levels greater than 80 µg/dL, possible symptomatology at 50 µg/dL
- identify source: consider occupational history, exposures history, utensil history

**Clinical Features**
- abdominal pain, constipation, irritability, difficulty concentrating

**Treatment**
- chelation therapy: dimercaprol and EDTA are first line agents
Hemolytic Anemia

**Definition**
- anemia due to a shortened survival of circulating RBCs, usually defined as <100 d
- uncommon cause for anemia (<5% of cases) with many etiologies (>200)

**Classification**
- hereditary
  - abnormal membrane (spherocytosis, elliptocytosis)
  - abnormal enzymes (pyruvate kinase deficiency, G6PD deficiency)
  - abnormal hemoglobin synthesis (thalassemias, hemoglobinopathies)
- acquired
  - immune
    - autoimmune: warm vs. cold autoimmune hemolytic anemias (AIHA), see Table 14 Classification of AIHA, H22
    - alloimmune: hemolytic disease of the fetus/newborn, post-transfusion
  - non-immune
    - MAHA/TMA, now known as TMA: thrombus in blood vessel causes RBCs to be sheared
      - associated with DIC, HUS, aHUS, TTP; preeclampsia/HELLP; vasculitides, malignant hypertension
    - other causes: PNH, hypersplenism, march hemoglobinuria (exertional hemolysis), infection (e.g. malaria), snake venoms, mechanical heart valves
- also classified as intravascular or extravascular
  - intravascular: MAHA/TMA (e.g. TTP, DIC), infections (malaria, Clostridium), and PNH
  - extravascular: RBCs are coated with antibodies (AIHA) or have an abnormal membrane structure/shape or inclusions

**Clinical Features Specific to HA**
- jaundice
- dark urine (hemoglobinuria, bilirubin)
- cholelithiasis (pigment stones)
- potential for an aplastic crisis (i.e. BM suppression in overwhelming infection)
- iron overload with extravascular hemolysis
- iron deficiency with intravascular hemolysis

**Investigations**

<table>
<thead>
<tr>
<th>Screening Tests</th>
<th>Tests Specific For Intravascular Hemolysis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Increased LDH</td>
<td>Schistocytes on blood film</td>
</tr>
<tr>

</tr>
<tr>
<td>Increased urobilinogen</td>
<td>Hemoglobinuria (immediate)</td>
</tr>
<tr>
<td>Reticulocytosis</td>
<td>Hemosiderinuria (delayed) – most sensitive</td>
</tr>
</tbody>
</table>

**Tests Specific For Extravascular Hemolysis**

**Direct Antiglobulin Test (direct Coombs)**
Detects IgG or complement on the surface of RBCs
Add anti-IgG or anti-complement Ab to patient’s RBCs; positive if agglutination
Indications: hemolytic disease of newborn, AIHA, hemolytic transfusion reaction

**Indirect Antiglobulin Test (indirect Coombs)**
Detects antibodies in serum that can recognize antigens on RBCs
Mix patient’s serum + donor RBCs + Coombs serum (anti-human Ig Ab); positive if agglutination
Indications: cross-matching donor RBCs, atypical blood group, blood group Ab in pregnant women, AIHA

**Thalassemia**

**Definition**
- defects in production of the α or β chains of hemoglobin
  - resulting imbalance in globin chains leads to ineffective erythropoiesis and hemolysis in the spleen or BM
- clinical manifestations and treatment depends on specific gene and number of alleles affected
- common features
  - increasing severity with increasing number of alleles involved
  - hypochromic microcytic anemia
  - basophilic stippling, abnormally shaped RBCs on blood film
  - α-Thal → prevalent in South East Asia (SEA) and Africa (α = Asia, Africa)
  - β-Thal → prevalent in Mediterranean
Pathophysiology
- defect may be in any of the Hb genes
  - normally 4α genes in total; 2 on each copy of chromosome 16
  - normally 2β genes in total; 1 on each copy of chromosome 11
  - fetal hemoglobin, HbF (α2γ2), switches to adult forms HbA (α2β2) and HbA2 (α2δ2) at 3-6 mo of life
  - HbA constitutes 97% of adult hemoglobin
  - HbA2 constitutes 3% of adult hemoglobin

β-Thalassemia Minor (Thalassemia Trait)

Definition
- defect in single allele of β gene (heterozygous for one normal beta globin allele and one beta globin thalassemic allele)
- common in people of Mediterranean and Asian descent

Clinical Features
- usually asymptomatic; a palpable spleen is very rare

Investigations
- Hb (100-140 g/L), MCV(<70), Fe (normal), RBC count (normal)
- peripheral blood film – microcytosis basophilic stippling
- Hb electrophoresis
  - specific: HbA2 increased to 3.5-5% (normal 1.5-3.5%)
  - non-specific: 50% have slight increase in HbF

Treatment
- no treatment required
- genetic counselling for patient and family

β-Thalassemia Major

Definition
- defect in both alleles of β gene ( homozygous, autosomal recessive)

Pathophysiology
- ineffective chain synthesis leading to ineffective erythropoiesis, hemolysis of RBCs, and increase in HbF

Clinical Features
- initial presentation at age 6-12 mo when HbA (α2/β2) normally replaces HbF (α2/γ2)
  - severe anemia, jaundice
- iron overload progressing to hemochromatosis
  - secondary to repeated transfusions and ineffective erythropoiesis
  - leads to iron-induced organ damage (see Gastroenterology, G26)
- stunted growth and development (hypogonadal dwarf)
- gross hepatosplenomegaly (due to extramedullary hematopoiesis)
- radiologic changes (due to expanded marrow cavity) and extramedullary hematopoietic masses (erythroid tissue tumours)
  - skull x-ray has “hair-on-end” appearance
  - pathologic fractures common
- evidence of increased Hb catabolism (e.g. pigmented gallstones)
- death can result from
  - untreated anemia (should transfuse)
  - infection (should identify and treat early)
  - iron overload (common): late complication from repeated transfusions and ineffective erythropoiesis

Investigations
- severe microcytic anemia (Hb <60 g/L)
- peripheral blood film: teardrop, target, hypochromatic, microcytic
- Hb electrophoresis
  - HbA: 0-10% (normal >95%)
  - HbA2 >2.5%
  - HbF: 90-100%

Treatment
- lifelong regular transfusions to suppress endogenous erythropoiesis
- iron chelation (e.g. deferoxamine, deferasirox, deferiprone) to prevent iron overload in organs and the formation of free radicals (which promote tissue damage and fibrosis)
- folic acid supplementation if not transfused
- allogenic bone marrow transplantation (potentially curative) or cord blood transplant
- splenectomy (now performed less frequently)
β-Thalassemia Intermedia

Definition
- clinical diagnosis in patients whose clinical manifestations are too mild to be classified as thalassemia major, but too severe to be classified as thalassemia minor

Clinical Features
- wide variety of clinical phenotypes
- in most cases of TI, both β-globin genes affected
- three main mechanisms account for the milder phenotype compared to thalassemia major: (1) subnormal (vs. absent) beta-chain synthesis, (2) increased number of gamma chains, (3) coinheritance of alpha thalassemia (in some cases)
- complications more commonly seen in TI than thalassemia major include extramedullary hematopoiesis, leg ulcers, gallstones, thrombosis, and pulmonary hypertension, and growth retardation

α-Thalassemia

Definition
- defect(s) in α genes
- similar geographic distribution as β-thalassemia, but higher frequency among Asians and Africans

Clinical Features
- 1 defective α gene (αα/α–): clinically silent; normal Hb, normal MCV
- 2 defective α genes (αα/α–; or trans: αα/α–): decreased MCV, normal Hb
  - N.B. cis 2-gene deletion more common in Asia vs. trans 2-gene deletion more common in Africa – this leads to increased risk of fetal hydrops in offspring of Asian patients vs. African patients
- 3 defective α genes (αα/α–): HbH (β4) disease; presents in adults, decreased MCV, decreased Hb, splenomegaly
- 4 defective α genes (αα/α–): Hb Barts (γ4) disease (hydrops fetalis); usually incompatible with life

Investigations
- peripheral blood film – screen for HbH inclusion bodies with supravital stain
- electrophoresis can be used to identify HgH disease, definitive diagnosis with DNA genotyping

Treatment
- depends on degree of anemia, referral for genetic/prenatal counselling
  - 1 or 2 defective α genes: no treatment required
  - HbH disease: similar to β-thalassemia intermedia
  - HbBarts: no definitive treatment, majority of pregnancies terminated (fetal/maternal mortality risk), intrauterine transfusion, stem cell transplants

Sickle Cell Disease

Definition
- autosomal recessive sickling disorders arise due to a mutant β-globin chain, most commonly caused by a Glu → Val substitution at position 6 (chromosome 11) resulting in HbS variant, rather than HbA (normal adult Hb)
  - increased incidence of HbS allele with African or Mediterranean heritage (thought to be protective against malaria)
  - sickle cell disease occurs when an individual has two HbS genes (homozygous, HbSS) or one HbS gene + another mutant β-globin gene (compound heterozygote) – most commonly HbS-α-thal and HbSβ'

Pathophysiology
- at low pO2, deoxy HbS polymerizes leading to rigid crystal-like rods that distort membranes → ‘sickles’
  - the pO2 level at which sickling occurs is related to the percentage of HbS present
  - sickling aggravated by acidemia, increased CO2, increased 2,3-DPG, fever, and osmolality
  - fragile sickle cells then cause injury in two main ways
    1. fragile sickle cells hemolysise (nitric oxide depletion)
    2. occlusion of small vessels (hypoxia, ischemia-reperfusion injury)

Clinical Features
- HbAS (sickle cell trait): patient will be asymptomatic except during extreme hypoxia or infection
- increased risk of renal medullary carcinoma
- SCD-SS (HbSS)
  - chronic hemolytic anemia
  - jaundice in the first yr of life
  - retarded growth and development ± skeletal changes
  - splenomegaly in childhood; splenic atrophy in adulthood

Functional asplenism: increased susceptibility to infection by encapsulated organisms
- S. pneumoniae
- N. meningitidis
- H. influenzae
- Salmonella (osteomyelitis)
SCD-SS often presents with acute pain episode
1. aplastic crises
   - toxins and infections (especially parvovirus B19) transiently suppress bone marrow
2. splenic sequestration crises
   - usually in children; significant pooling of blood in spleen resulting in acute Hb drop and shock
   - uncommon in adults due to asplenia from repeated infarction
3. vaso-occlusive crises (infarction)
   - may affect various organs causing ischemia-reperfusion injury (especially in back, chest, abdomen, and extremities), fever, and leukocytosis
   - can cause a stroke or a silent myocardial infarction
   - precipitated by infections, dehydration, rapid change in temperature, pregnancy, menses, and alcohol
4. acute chest syndrome (see sidebar)
SCD-SC (most common compound heterozygote)
- 1:333 live births in African-Americans, common in West Africa
- milder anemia than HbSS
- similar complications as HbSS, although typically milder and less frequent (exception is proliferative sickle retinopathy, glomerulonephritis, and avascular necrosis)
- spleen not always atrophic in adults

Investigations
- sickle cell prep (detects sickling of RBCs under the microscope in response to O₂ lowering agent): determines the presence of a Hb SS allele, but does not distinguish HbAS from HbSS
- Hb electrophoresis distinguishes HbAS, HbSS, HbSC, and other variants
- all newborns in developed countries typically screened for SCD

<td></td>
</tr>
</tbody>
</table>

Treatment
- genetic counselling
- HbAS: no treatment required
- HbSC: treatment as per HbSS, but is dictated by symptom severity
- HbSS
  1. folic acid to prevent folate deficiency
  2. hydroxyurea to enhance production of HbF
     - mechanism of action: stops repression of Hb-γ chains and/or initiates differentiation of stem cells in which this gene is active
     - presence of HbF in the SS cells decreases polymerization and precipitation of HbS
     - N.B. hydroxyurea is cytotoxic and may cause bone marrow suppression
  3. treatment of vaso-occlusive crisis
     - supportive care: oxygen, hydration (reduces viscosity), correct acidosis, analgesics/opiates
     - indication for exchange transfusion: Hb <50-60 g/L, SCD complications (acute chest syndrome, aplastic crisis, hepatic or splenic sequestration, stroke), prevention of complications, pre-operative
     - less routinely: antimicrobials for suspected infection
  4. prevention of crises
     - establish diagnosis
     - avoid conditions that promote sickling (hypoxia, acidosis, dehydration, fever)
     - vaccination in childhood (pneumococcus, meningococcus, H. influenzae b)
     - prophylactic penicillin (age 3 mo-5 yr)
     - good hygiene, nutrition, and social support
  5. screen for complications
     - regular blood work (CBC, reticulocytes, iron indices, BUN, LFTs, creatinine)
     - urinalysis annually (proteinuria, glomerulopathy)
     - transcranial doppler annually until 16 yr old (stroke prevention)
     - retinal examinations annually from 8 yr old (screen for retinopathy)
     - echocardiography once in late childhood/early adulthood (screen for pulmonary hypertension)

NIH Consensus Development Conference
Statement: Hydroxyurea Treatment for Sickle Cell Disease
Efficacy: Strong evidence for adolescents and adults and there is emerging data supporting its use in children. In the single RCT, the Hb level was higher in hydroxyurea recipients than placebo recipients after 2 yr (difference, 6 g/L), as was HbF (absolute difference, 3.2%). The median number of painful crises was 44% lower than in the placebo arm. The 12 observational studies that enrolled adults reported a relative increase in HbF of 4-20% and a relative reduction in crisis rates by 40-84%. Hospital admissions declined by 18-32%.
Effectiveness: Data is limited. It seems to be highly effective but is currently underestimated.
Short-Term Harms (within 6 mo): Dose-related leukopenia, thrombocytopenia, anemia, and decreased reticulocyte count. Others include decreased sperm production and dry skin.
Long-Term Harms: Birth defects in offspring of people receiving the drug, growth delays in children receiving the drug, and cancer in both children and adults who receive the drug.
Autoimmune Hemolytic Anemia

Microangiopathic Hemolytic Anemia/Thrombotic Microangiopathy

Definition
- hemolytic anemia due to intravascular fragmentation of RBCs

Etiology
- see Thrombotic Thrombocytopenic Purpura and Hemolytic Uremic Syndrome, H30
- see Disseminated Intravascular Coagulation, H32
- eclampsia, HELLP syndrome, AFLP (see Obstetrics, OB25)
- malignant hypertension
- vasculitis
- malfunctioning heart valves
- metastatic carcinoma
- drugs (calcineurin inhibitors, quinine, simvastatin)
- infections (severe CMV or meningococcus)
- catastrophic antiphospholipid antibody syndrome

Investigations
- blood film: evidence of hemolysis, schistocytes
- hemolytic workup
- urine: hemosiderinuria, hemoglobinuria

Hereditary Spherocytosis

- most common type of hereditary hemolytic anemia
- abnormality in RBC membrane proteins (e.g. spectrin)
  - spleen makes defective RBCs more spherocytotic (and more fragile) by membrane removal; also acts as site of RBC destruction
  - autosomal dominant with variable penetrance

Investigations
- blood film (shows spherocytes), osmotic fragility (increased), molecular analysis for spectrin gene

Treatment
- in severe cases, splenectomy and vaccination against pneumococcus, meningococcus, and H. influenza b (avoid in early childhood)
Hereditary Elliptocytosis

Definition/Etiology
- abnormality in spectrin interaction with other membrane proteins
- autosomal dominant
- 25-75% elliptocytes
- hemolysis is usually mild

Treatment
- immunizations; splenectomy for severe hemolysis

Glucose-6-Phosphate Dehydrogenase Deficiency

Definition
- deficiency in glucose-6-phosphate dehydrogenase (G6PD), corresponding to a lack of reduced glutathione (GSH) and leading to RBC sensitivity due to oxidative stress

Pathophysiology
- X-linked recessive, prevalent in individuals of African, Asian, and Mediterranean descent

Clinical Features
- frequently presents as episodic hemolysis precipitated by:
  - oxidative stress
  - drugs (e.g. sulfonamide, antimalarials, nitrofurantoin)
  - infection
  - food (fava beans)
- in neonates: can present as prolonged, pathologic neonatal jaundice

Investigations
- neonatal screening
- G6PD assay (may not be useful if result is normal)
  - should not be done in acute crisis when reticulocyte count is high (reticulocytes have high G6PD levels)
- blood film
  - Heinz bodies (granules in RBCs due to oxidized Hb); passage through spleen results in the generation of bite cells
  - may have features of intravascular hemolysis (e.g. RBC fragments)

Treatment
- folic acid
- stop offending drugs and avoid triggers
- transfusion in severe cases

Macrocytic Anemia

- MCV >100 fl.
- see Figure 2, Approach to Anemia, H6

Table 15. Comparison Between Megaloblastic and Non-Megaloblastic Macrocytic Anemia

</tr>
</tbody>
</table>

Causes of Macrocytic Anemia
- ABCDEF
  - Alcoholism (liver disease)
  - B- deficiency
  - Compensatory reticulocytosis
  - Drugs (cytotoxic, AZT)/Dysplasia
  - Endocrine (hypothyroidism)
  - Folate deficiency/Fetus (pregnancy)

Characteristics of Megaloblastic Macrocytic Anemia
- Pancytopenia
- Hypersegmented neutrophils
- Megaloblastic bone marrow
## Vitamin B12 Deficiency

B12 (cobalamin) see *Family Medicine – Nutrition, FM6*
- binds to intrinsic factor (IF) secreted by gastric parietal cells
- absorbed in terminal ileum
- total body stores sufficient for 3-4 yr

### Etiology

**Table 16. Etiology of Vitamin B12 Deficiency**

<table>
<thead>
<tr>
<th>Diet</th>

<td>Drugs</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Neomycin, biguanides, PPI, N/L anesthesia, metformin</td>
<td></td>
</tr>
</tbody>
</table>

### Pathophysiology of Pernicious Anemia

- auto-antibodies produced against gastric parietal cells leading to achlorhydria and lack of intrinsic factor secretion
- intrinsic factor is required to stabilize B12 as it passes through the bowel
- decreased intrinsic factor leads to decreased ileal absorption of B12
- may be associated with other autoimmune disorders (polyglandular endocrine insufficiency)
- most common in Northern European Caucasians, usually >30 yr old (median age of 60 yr old)

### Clinical Features

- neurological (severity of anemia and neurological sequelae depends on deficiency)
  - peripheral neuropathy (variable reversibility)
  - usually symmetrical, affecting lower limbs more than upper limbs
  - cord (irreversible damage)
- subacute combined degeneration
  - posterior columns: decreased vibration sense, proprioception, and 2-point discrimination, parasthesia
  - pyramidal tracts: spastic weakness, ataxia
- cerebral (common, reversible with B12 therapy)
- confusion, delirium, dementia
- cranial nerves (rare)
- optic atrophy

### Investigations

- CBC, reticulocyte count
  - anemia often severe ± neutropenia ± thrombocytopenia
  - MCV >110 fL
  - low reticulocyte count relative to the degree of anemia (<2%)
- serum B12 and RBC folate
  - caution: low serum B12 leads to low RBC folate because of failure of folate polyglutamate synthesis in the absence of B12
  - alternatively, can measure elevated urine metabolites (methylmalonate, homocysteine)
- blood film
  - oval macrocytes, hypersegmented neutrophils
- bone marrow
  - hypercellularity
  - nuclear-cytoplasmic asynchrony in RBC precursors (less mature nuclei than expected from the development of the cytoplasm)
- bilirubin and LDH
  - elevated unconjugated bilirubin and LDH due to breakdown of cells in BM
- Schilling test (radiolabeled B12 test, rarely done) to distinguish pernicious anemia from other causes
  - anti-intrinsic factor antibody, anti-parietal cell antibody

### Treatment

- vitamin B12 1,000 µg IM or 1,000-2,000 µg PO if intestinal absorption intact, route and duration depends on cause
- less frequent, higher doses may be as effective (e.g. 1,000 µg IM q3mo)
- watch for hypokalemia and rebound thrombocytosis when treating severe megaloblastic anemia

### Oral Vitamin B12 vs. Intramuscular Vitamin B12 for Vitamin B12 Deficiency

**Cochrane DB Syst Rev 2005;2:CD004655**

**Study:** Systematic review; 2 RCTs met inclusion criteria; total 108 patients with follow-up from 90-4 mo.

**Intervention:** One study evaluated 1,000 µg of oral B12 compared to 1,000 µg IM B12 on the same dosing schedule. The other compared 2,000 µg daily oral B12 to 1,000 µg IM B12 on a less frequent dosing schedule. Neurological and hematological endpoint rates were evaluated.

**Results:** Meta-analysis was not attempted due to study heterogeneity. Both studies reported improvements in hematological and neurological end-points in both oral and IM groups. No significant difference was observed between groups in either study.

**Conclusions:** Limited data suggests high dose oral vitamin B12 (1,000-2,000 µg) is equivalent to IM vitamin B12 on the same or less frequent dosing schedule. This data is limited by small sample sizes and short follow-up periods. However, it suggests that a 3 to 4 month trial of oral supplementation is a reasonable first choice for patients with B12 deficiency.

### Schilling Test

**Part 1**

- Tracer dose (1 µg) of radiolabeled B12, given PO
- Flush through dose (1 mg) of unlabeled B12 IM 1 h later to saturate tissue binders of B12 thus allowing radioactive B12 to be excreted in urine
- 24 h urine radiolabeled B12 measured
- Normal ≤ 5% excretion (a normal excretion will only be seen if the low B12 was due to dietary deficiency)

**Part 2**

- Same as part 1, but radiolabeled B12 given with oral intrinsic factor
- Should be done only if first stage shows reduced excretion
- Normal test result (= 5% excretion) = pernicious anemia
- Abnormal test result (< 5% excretion) = intestinal causes (malabsorption)
Folate Deficiency

• uncommon in developed countries due to extensive dietary supplementation (enriched in flour)
• folate stores are depleted in 3-6 mo
• folate commonly found in green, leafy vegetables and fortified cereals

Etiology

Table 17. Etiology of Folate Deficiency

<table>
<thead>
<tr>

</tbody>
</table>

Clinical Features

• anemia, mild jaundice, glossitis, diarrhea, confusion, pallor
• unlike B₁₂ deficiency, folate deficiency has no neurologic manifestations
• consider social history, alcohol/drug abuse, very poor diet (e.g. elderly, depressed)

Investigations

• similar to B₁₂ deficiency (CBC, reticulocytes, blood film, RBC folate, serum B₁₂)
• if decreased RBC folate, rule out B₁₂ deficiency as cause

Management

• folic acid 1-5 mg PO OD x 1-4 mo; then 1 mg PO OD maintenance if cause is not reversible

Hemostasis

Stages of Hemostasis

1. Primary Hemostasis

• cellular defense – involves the platelet and VWF predominantly
• goal is rapid cessation of bleeding; main effect is on mucocutaneous bleeding
• vessel injury results in collagen/subendothelial matrix exposure and release of vasoconstrictors
• blood flow is impeded and platelets come into contact with damaged vessel wall (Figure 11a)
  • adhesion: platelets adhere to subendothelium via Von Willebrand factor (VWF)
  • activation: platelets are activated resulting in change of shape and release of ADP and thromboxane A₂
  • aggregation: these factors further recruit and aggregate more platelets resulting in formation of localized hemostatic plug

2. Secondary Hemostasis

• platelet plug is reinforced by production of fibrin clot (Figure 11b)
• extrinsic (initiation) pathway: initiation of coagulation in vivo
• intrinsic (amplification) pathway: amplification once coagulation has started via positive feedback
• both intrinsic and extrinsic pathways converge onto the common pathway which results in thrombin generation and fibrin formation

3. Fibrin Stabilization

• conversion from soluble to insoluble and stable clot

4. Fibrinolysis

• once healing initiated, clot dissolution via action of the fibrinolytic system

**Fibrinolysis**

- **Euglobulin lysis time**
  - N > 90 min
  - Looks for accelerated fibrinolysis
  - May be accelerated in DIC or factor XIII deficiency
  - Decreased in hereditary deficiency of fibrinogen

**Other**

- **Fibrinogen**
- **D-dimer**
- **Specific factor assays (e.g. factor VIII)**
- **Lupus anticoagulant**
- **Thrombophilia tests (e.g. activated protein C resistance)**
- **Von Willebrand tests (VWF antigen, Ristocetin cofactor activity, factor VIII)**

Disorders of Primary Hemostasis

Definition

- inability to form an adequate platelet plug due to
  - disorders of blood vessels
  - disorders of platelets: abnormal function/numbers
  - disorders of VWF

Classification

![Figure 13. Approach to disorders of primary hemostasis](image)

Terminology of ITP

- primary: isolated thrombocytopenia (platelet count <100x10⁹/L) with no other cause of thrombocytopenia
- secondary: thrombocytopenia associated with another condition (e.g. HIV, HCV, SLE, CLL)
- drug-induced: drug-dependent platelet antibodies causing platelet destruction
Classification of primary ITP
- acute: newly diagnosed (diagnosis to 3 mo)
- persistent: 3-12 mo from diagnosis
- chronic: >12 mo
- refractory: post-splenectomy

Pathophysiology
- primary or secondary ITP
- an acquired immune-mediated disorder (pathophysiology incompletely understood)
  - anti-platelet antibodies bind to platelet surface → increased splenic clearance
  - impaired platelet production
  - helper T-cell and cytotoxic T-cell activation also implicated in platelet destruction
- Direct effect of HIV on marrow
- Immune-mediated platelet destruction
- Some anti-retrovirals reduce platelet production

Clinical Presentation
- variable presentation: asymptomatic, fatigue, minimal bruising, mucocutaneous bleed, intracranial bleed
- assess for symptoms/signs suggesting a secondary cause

Investigations
- CBC and reticulocyte count: thrombocytopenia
- PT and aPTT: normal
- peripheral blood film: decreased platelets, giant platelets (rule out platelet clumping)
- HIV, HCV, H. pylori serology
- vitamin B12, ANA, C3, C4, depending on clinical symptoms
- bone marrow aspirate and biopsy: increased number of megakaryocytes
  - recommended in patients >60 yr of age, pre-splenectomy or have failed traditional ITP therapy, those with systemic symptoms, an abnormal blood film
  - bone marrow aspirate and biopsy should be considered if there is any suspicion of diminished bone marrow function (e.g. myelodysplasia, infiltration)

Treatment
- rarely indicated if platelets >30 x 10^9/L unless active bleeding, trauma, or surgery
- emergency treatment (active bleeding [CNS, GI, or GU] or in need of emergency surgery)
  - general measures: stop drugs that reduce platelet function, control blood pressure, minimize trauma
  - corticosteroids: prednisone (1 mg/kg) or dexamethasone (40 mg PO x 4 d)
  - antifibrinolytic: tranexamic acid (1 g PO tid or 1 g IV q6h) if mucosal bleeding
  - IVlg 1 g/kg/d x 2 doses
  - platelet transfusion: for refractory, major bleeding or need for urgent surgery (expect that platelet recovery will be diminished)
  - emergency splenectomy: may be considered, vaccinations prior if possible (pneumococcus, meningococcus, H. influenzae b)
  - management of intracranial bleeding: IV steroids, IVlg, platelets
- non-urgent treatment (platelet count <20-30 x 10^9/L and no bleeding)
  - 1st line
    - corticosteroids (dexamethasone 40 mg qd x 4 days x 1-4 cycles (not weeks) or prednisone x 3 weeks then taper)
    - IVlg
  - anti-D: appropriate for Rh+ non-splenectomized patients, but can cause hemolysis (avoid if low Hb at baseline or if DAT is positive)
  - 2nd line
    - splenectomy (need vaccinations prior to splenectomy: pneumococcus, meningococcus, H. influenzae b)
    - rituximab
  - 3nd line
    - thrombopoietin (TPO) receptor agonists (romiplostim, eltrombopag) – may be considered for second line therapy if funding available
    - immunomodulating therapy (azathioprine, cyclophosphamide, danazol, vincristine)

Definitions of response to treatment
- complete response: platelet >100
- partial response: platelet 30-100
- no response: platelet <30

Prognosis
- ~20% will not attain a hemostatic platelet count after first and second line therapy
- fluctuating course
- overall relatively benign, life-expectancy similar to general population (however, risk of mortality from bleeding/infection increases with advancing age)
- major concern is spontaneous intracranial hemorrhage if platelet <5 x 10^9/L, more common in the elderly
Table 22. Heparin-Induced Thrombocytopenia (HIT)

Pathophysiology

Immune mediated
Ab recognizes a complex of heparin and platelet factor 4 (PF4) leading to platelet activation via platelet Fc receptor and activation of coagulation system

Diagnosis

Suspected with intermediate or high probability HIT Score (Table 23)
Confirm with ELISA testing and SRA testing

Onset of Decreased Platelets

5-15 d (if previously exposed to heparin within 100 d, HIT can develop in hours due to an anamnestic response)

Risk of Thrombosis

~30% to 50% (25% of events are arterial)

Clinical Features

Bleeding complications uncommon
Venous thrombosis: DVT, PE, limb gangrene, cerebral sinus thrombosis
Arterial thrombosis: MI, stroke, acute limb ischemia, organ infarct (mesentery, kidney)
Heparin-induced skin necrosis (with LMWH)
Acute platelet activation syndromes: acute inflammatory reactions (e.g. fever/chills, flushing, etc.)
Transient global amnesia (rare)

Specific Tests

Re-test clinical scoring models can help rule-out HIT: 4-Ts (see Table 23) and the HIT Expert Probability (HEP) score
14C serotonin release assay (uses donor platelets with 14C serotonin and heparin with patient’s plasma)
ELISA for HIT-Ig (more sensitive, less specific than serotonin assay)
Ultrasound of lower limb veins for DVT

Management

Clinical suspicion of HIT should prompt discontinuation of heparin and LWMH (specific tests take several days)
Initiate anticoagulation with a non-heparin anticoagulant:
e.g. argatroban, danaparoid, fondaparinux, bivalirudin unless there is a strong contraindication
duration of treatment at least 2-3 mo if no thrombotic event, and at least 3-6 mo if thrombotic event has occurred
Warfarin should only be restarted when platelet count >150 x 10^9/L
Allergy band and alert in patient records

Table 23. The 4-T Pre-Test Clinical Scoring Model for HIT

Von Willebrand Disease

Pathophysiology
- most common inherited bleeding disorder (prevalence of 1%)
- usually autosomal dominant (type 3 is autosomal recessive)
- women more commonly diagnosed (heavy menstrual bleeding, peripartum bleeding)
- qualitative defect or quantitative deficiency of VWF depending on type
  - VWF needed for platelet adhesion/aggregation and acts as chaperone for Factor VIII (extending its half-life in circulation), therefore abnormality of VWF can affect both primary and secondary hemostasis
  - VWF exists as a series of multimers ranging in size
    - largest multimers are most active in mediation of platelet adhesion/aggregation
    - both large and small multimers complex with Factor VIII
    - VWF levels vary according to blood group (non-group O patients have higher levels than group O patients)

Classification
- type 1: mild quantitative defect (decreased amount of VWF and proportional decrease in VWF activity) – 80% of cases
- type 2: qualitative defect (VWF activity disproportionally lower than quantity) – 20% of cases
- type 3: severe total quantitative defect (virtually no VWF produced), 1 per million

Clinical Features
- bleeding history is the single most important predictor of an underlying bleeding disorder
- validated, standardized bleeding assessment tools (e.g. ISTH-BAT) to facilitate exploration of the bleeding history
- mucocutaneous bleeding (easy bruising, epistaxis, heavy menstrual bleeding, peripartum bleeding, post-dental extraction bleeding, post-operative bleeding, gastrointestinal bleeding)
  - type 3 VWD patients can experience musculoskeletal bleeding due to significant deficiency in FVIII due to lack of FVIII chaperoning as VWF is absent

Investigations
- CBC, platelet, VWF:Antigen (determine how much VWF is present), VWF:Ristocetin cofactor activity (determine how well VWF bind to platelet), Factor VIII (determine how well VWF chaperon with FVIII), PTT
- tests to further categorize type/subtype of VWD: multimer analysis, ristocetin induced platelet agglutination, genetic studies
Table 25. Investigations in VWD

**Treatment**

- desmopressin (DDAVP®) is effective treatment for 85-90% of patients with type 1 VWD and for some subtypes of type 2 VWD
  - causes release of VWF and Factor VIII from endothelial cells
  - variable efficacy depending on disease type; tachyphylaxis occurs after 4 consecutive doses
  - need to document responsiveness with “DDAVP challenge”
  - caution in children due to hyponatremia
- tranexamic acid (Cyklokapron®, antifibrinolytic) to stabilize clot formation
- VWF:FVIII concentrate (Humate P®, Wilate®) if DDAVP unresponsive/clinically ineffective or for severe bleeding episode
  - need to monitor VWF and factor VIII levels (very high factor VIII level can be prothrombotic)
- gynecologic focused care for heavy menstrual bleeding (NB estrogens have the added benefit of increasing VWF levels)

**Prognosis**

- patients with mild type 1 VWD have auto-correction of VWF deficiency in pregnancy
- patients are best managed by a hematologist, ideally one who works in a Hemophilia Treatment Centre (HTC)

---

**Disorders of Secondary Hemostasis**

**Definition**

- inability to form an adequate fibrin clot
  - disorders of clotting factors or co-factors
  - disorders of proteins associated with fibrinolysis
- characterized by delayed bleeding, deep muscular bleeding, spontaneous hemarthroses

**Table 26. Classification of Secondary Hemostasis Disorders**

**Hemophilia A (Factor VIII Deficiency)**

**Pathophysiology**

- X-linked recessive, 1/5,000 males
- mild (>5% of normal factor level), moderate (1-5%), severe (<1%)

**Clinical Features**

- see Table 19 – Signs and Symptoms of Disorders of Hemostasis, H26
- older patients may also have HIV or HCV from contaminated blood products

**Investigations**

- prolonged aPTT, normal INR (PT)
- decreased Factor VIII (<40% of normal)

**Treatment**

- desmopressin (DDAVP®) in mild hemophilia A
- Factor VIII concentrate for:
  - prophylaxis
  - on-demand (i.e. to treat a bleed)
- anti-fibrinolytic agents (e.g. tranexamic acid)

**Hemophilia B (Factor IX Deficiency)**

- X-linked recessive, 1/30,000 males; approximately half have severe disease (factor IX activity <1% of normal)
- clinical and laboratory features identical to hemophilia A (except decreased Factor IX)
- treatment: Factor IX concentrate (prophylaxis or on-demand), anti-fibrinolytic agents
**Factor XI Deficiency**

- autosomal recessive; more common in Ashkenazi Jewish population
- usually mild, often diagnosed in adulthood
- Factor XI level does not correlate with bleeding risk – risk of bleeding correlates with a previous history or family history of bleeding
- treatment: antifibrinolytic agents, frozen plasma, Factor XI concentrate

**Liver Disease**

- see Gastroenterology, G32

**Pathophysiology**

- deficient synthesis of all factors except VIII (also made in endothelium)
- aberrant or diminished synthesis of fibrinogen (factor I)
- diminished synthesis of natural anticoagulants and altered regulation of fibrinolysis

**Investigations**

- peripheral blood film: target cells
- primary hemostasis affected
  - thrombocytopenia 2º to hypersplenism, nutritional deficiency, direct bone marrow toxicity related to alcohol, diminished production from chronic viral infections (e.g. HCV), decreased production of thrombopoietin
- secondary hemostasis affected
  - elevated INR (PT), aPTT and TT, low fibrinogen in end-stage liver disease

**Treatment**

- supportive, treat liver disease, blood products if active bleeding (frozen plasma, platelets, cryoprecipitate)

**Vitamin K Deficiency**

**Etiology**

- drugs
  - vitamin K antagonist (e.g. Warfarin) – diminished production of functional Factors II, VII, IX, X, proteins C and S
  - antibiotics eradicating gut flora, altering vitamin K uptake
- poor diet (especially in alcoholics) e.g. prolonged fasting or starvation
- biliary obstruction
- chronic liver disease (decreased stores)
- fat malabsorption (e.g. celiac disease, disorders of bile or pancreatic secretion, intestinal disease, CF)
- hemorrhagic disease of newborn, see Pediatrics, P46

**Investigations**

- INR (PT) is elevated out of proportion to elevation of the aPTT
- decreased Factors II, VII, IX, X (vitamin K-dependent)

**Treatment**

- hold anticoagulant if vitamin K antagonist on board
- vitamin K PO if no active bleeding
- if bleeding, give vitamin K 10 mg IV (reversal may take up to 12 hrs)
- if life-threatening bleeding and vitamin K antagonist used, give prothrombin complex concentrate (PCC) or FP if PCC contraindicated
  - PCCs are contraindicated if there is a previous history of HIT (heparin is within the PCC product)

**Disseminated Intravascular Coagulation**

**Definition**

- excessive, dysregulated release of plasmin and thrombin leading to intravascular coagulation and depletion of platelets, coagulation factors and fibrinogen
- risk of life-threatening hemorrhage or thromboembolism

**Etiology**

- occurs as a complication of many other severe medical, surgical or obstetrical conditions
- widespread endothelial damage and extensive inflammatory cytokine release

**Factor Levels in Acquired Coagulopathies**

Investigations
- primary hemostasis: decreased platelets
- secondary hemostasis: prolonged INR (PT), aPTT, TT, decreased fibrinogen and other factors
- fibrinolysis: increased FDPs or D-dimers, short euglobulin lysis time (i.e. accelerated fibrinolysis)
- extent of fibrin deposition: urine output, RBC fragmentation

Treatment
- recognize early and treat underlying disorder - supportive measures: hemodynamic and/or ventilator support, aggressive hydration, RBC transfusion if severe bleed
- in hemorrhage: replacement of hemostatic elements with platelet transfusion, frozen plasma, cryoprecipitate
  - British Hematology Guidelines:
    - maintain platelets >50 x10^9, hemoglobin >80 g/L, calcium between 2.2-2.7 mmol/L, and avoid hypothermia
    - 4-5 units of FP if INR >1.5 or aPTT >38
    - 10 units of cryoprecipitate if fibrinogen <1 g/L
    - 1 adult dose of buffy-coat platelets if <10 x10^9 (<20 if febrile, <50 before invasive procedure)
- in thrombotic phase: UFH or LMWH in critically ill, non-bleeding patients

Hypercoagulable Disorders

Hypercoagulability Workup – Venous Thrombosis
- work up for malignancy is suggested in the event of abnormal blood work, constitutional symptoms or physical exam suggestive of cancer
- work up for hypercoagulable state is controversial and should only be done if it will alter treatment decisions
- recommendations for a hypercoagulable work up include:
  - patients with recurrent or multiple thrombosis only if it will change management plans
  - warfarin-induced skin necrosis or neonatal purpura fulminans (protein C or S deficiency)
  - consider for patients with a family history of VTE who are considering OCP use
  - consider for patients who present with thrombosis at an unusual venous site only if it will change management plans
- arterial thrombotic events have only been proven to be associated with APLA, HIT, JAK2 MPNs, and PNH
• work up
  ■ initial
    ◆ CBC, blood smear, coagulation studies, liver/renal function, urinalysis, hemolysis markers (if anemic)
    ◆ malignancy history, age appropriate cancer screening (see sidebar)
    ◆ serology: antiphospholipid antibodies (APLA)
  ■ post-treatment (or ≥6 weeks, as protein levels depleted/consumed by clot)
    ◆ antithrombin (not on heparin)
    ◆ proteins C, S (not on warfarin)
• note: most of these tests do not change management, and a negative test does not rule out a hypercoagulable state
  ◆ thus more focus on the reversible/treatable causes (APLA, cancer, etc.)

SELECTED CAUSES OF HYPERCOAGULABILITY LEADING TO VENOUS THROMBOEMBOLISM

Activated Protein C Resistance (Factor V Leiden)
• most common cause of hereditary thrombophilia
  • 3-7% of European Caucasian population are heterozygotes
  • point mutation in the Factor V gene (R506Q) results in resistance to inactivation of Factor Va by activated protein C

Prothrombin Gene Mutation (PT) G20210A
• 1-3% of European Caucasian population are heterozygotes
  • G to A transposition at nucleotide position 20210 of the prothrombin gene promoter region results in increased levels of prothrombin, thus increased thrombin generation

Protein C and Protein S Deficiency
• protein C inactivates Factor Va and VIIIa using protein S as a cofactor
• protein C deficiency
  ◆ homozygous or compound heterozygous: neonatal purpura fulminans
  ◆ heterozygous
    ■ type I: decreased protein C levels
    ■ type II: decreased protein C activity
  • acquired: liver disease, sepsis, DIC, warfarin, certain chemotherapeutic agents
  • 1/3 of patients with warfarin necrosis have underlying protein C deficiency
• protein S deficiency
  ◆ type I: decreased free and total protein S levels
  ◆ type II: decreased protein S activity
  ◆ type III: decreased free protein S levels
  • acquired: liver disease, DIC, pregnancy, nephrotic syndrome, inflammatory conditions, warfarin

Antithrombin Deficiency
• antithrombin slowly inactivates thrombin in the absence of heparin, rapidly inactivates thrombin in the presence of heparin
• autosomal dominant inheritance, urinary losses in nephrotic syndrome, or reduced synthesis in liver disease
• diagnosis must be made outside window of acute thrombosis and anticoagulation treatment (acute thrombosis, heparin, systemic disease all decrease antithrombin levels)
• deficiency may result in resistance to unfractionated heparin (LMWH may be considered, with monitoring of anti-Xa levels)
  ◆ heparin resistance: suspect if >35,000 units of UFH required during 24 hour use

Elevated Factor VIII Levels
• an independent marker of increased incident and recurrent thrombotic risk, but levels can also be increased in numerous states as an acute phase reactant, therefore its clinical use is controversial

Congenital Dysfibrinogenemia
• may predispose to thromboembolic disease, bleeding or both

Disorders of Fibrinolysis
• includes congenital plasminogen deficiency, tissue plasminogen activator deficiency, although association with VTE risk is not clear

Antiphospholipid Antibody Syndrome (APS)
• definition: ≥1 clinical and ≥1 laboratory criteria
  ◆ clinical: thrombosis, recurrent (>3) early pregnancy losses <10 weeks, one late fetal loss ≥10 weeks (morphologically normal), or premature birth before 34 wk due to (pre)eclampsia or placental insufficiency
  ◆ laboratory (must be confirmed on two occasions, tested ≥12 wks apart): antiphospholipid antibodies, anti-β2 glycoprotein-I antibody, lupus anticoagulant

Common Causes of Hypercoagulability

- Protein C deficiency
- Antithrombin deficiency
- Malignancy
- Antiphospholipid antibodies
- Prothrombin G20210A
- Increased Factor VIII (Eight)
- Protein S deficiency

Causes of Both Venous and Arterial Thrombosis include:
- Antiphospholipid antibodies
- Myeloproliferative neoplasms
- Heparin-induced thrombocytopenia
- Distal venous clot with patent foramen ovale
- Paroxysmal nocturnal hemoglobinuria

Malignancy is a common cause of acquired hypercoagulability

Work up should include:
- Complete history and physical
- Routine blood work
- Urinalysis
- CXR
- Age appropriate screening: mammogram, Pap, PSA, colonoscopy
- Close follow-up
- No benefit with CT imaging

Although lupus anticoagulant prolongs PTT, this is a misnomer, as its main clinical feature is thrombosis
Venous Thromboembolism

Definition
- thrombus formation and subsequent inflammatory response in a superficial or deep vein
- superficial thrombophlebitis, deep vein thrombosis (DVT), and pulmonary embolism (PE)
- thrombi propagate in the direction of blood flow (commonly originating in calf veins)
- more common in lower extremity than upper extremity
- incidence ~1% if age >60 yr
- most important sequelae are pulmonary embolism (~50% chance with proximal DVT) and chronic venous insufficiency

Etiology (Virchow’s Triad)
- endothelial damage
  - exposes endothelium to prompt hemostasis
  - leads to decreased inhibition of coagulation and local fibrinolysis
- venous stasis
  - immobilization (post-MI, CHE, stroke, post-operative) inhibits clearance and dilution of coagulation factors
- hypercoagulability
  - inherited (see Hypercoagulable Disorders, H33)
  - acquired
    - age (risk increases with age)
    - surgery (especially orthopedic, thoracic, GI, and GU)
    - trauma (especially fractures of spine, pelvis, femur or tibia, spinal cord injury)
    - neoplasms (especially lung, pancreas, colon, rectum, kidney, and prostate)
    - blood dyscrasias (myeloproliferative neoplasms, especially PV, ET), PNH, hyperviscosity (multiple myeloma, polycythemia, leukemia, sickle cell disease)
    - prolonged immobilization (CHF, stroke, MI, leg injury)
    - hormone related (pregnancy, OCP, HRT, SERMs)
    - APS
    - heart failure (risk of DVT greatest with right heart failure and peripheral edema)
    - idiopathic (10-20% are later found to have cancer)

Clinical Features of DVT
- absence of physical findings does not rule out disease
- unilateral leg edema, erythema, warmth, and tenderness purple-blue
- palpable cord (thrombosed vein)
- phlegmasia alba dolens (white appearance) and phlegmasia cerula dolens (acute pain and edema) with massive thrombosis
- Homans’ sign (pain with foot dorsiflexion) is unreliable

Differential Diagnosis of DVT
- muscle strain or tear, lymphangitis or lymph obstruction, venous valvular insufficiency, ruptured popliteal cysts, cellulitis, arterial occlusive disease

Investigations for DVT
- D-dimer test only useful to rule out DVT if negative with low clinical suspicion of disease and no other acute medical issues
- doppler ultrasound is most useful diagnostic test for DVT
  - sensitivity and specificity for proximal DVT ~95%
  - sensitivity for calf DVT ~70%
- other non-invasive tests include MRI and impedance plethysmography
- venography is the gold standard, but is expensive, invasive, and higher risk
- CTPA or V/Q scan if PE suspected

Post-Thrombotic Syndrome
- development of chronic venous stasis signs and symptoms secondary to a deep venous thrombosis
- symptoms: pain, venous dilatation, edema, pigmentation, skin changes, venous ulcers
- clinical severity can be estimated based on the Villalta score
- large impact on quality of life following a DVT
- treatment: extremity elevation, exercise, continuous compression stockings, intermittent pneumatic compression therapy, skin/ulcer care
- for clinical features and treatment of PE, see Respiratology, R18

Venous Thromboembolism in Patients with Cancer

Methods: Patients with cancer who had acute, symptomatic proximal DVT, PE, or both were randomly assigned to either dalteparin or coumarin treatment for 6 mo.

Results: 27 of 338 patients in the dalteparin group had recurrent VTE versus 53 of 338 patients in the coumarin group (hazard ratio, 1.48; p = 0.002). The probability of recurrent thromboembolism at 6 mo was 9% and 17% in dalteparin and coumarin groups respectively. There was no significant difference in bleeding rates. The mortality rate was 39% in the dalteparin group and 41% in the coumarin group.

Conclusions: In patients with cancer and acute VTE, dalteparin was more effective than coumarin in decreasing the risk of recurrent thromboembolism without increasing the risk of bleeding.

Wells’ Score for DVT
Criteria (Score)
- Paralysis, paresis, or recent orthopedic casting of lower extremity (1)
- Recently bedridden (>3 d) or major surgery within past 4 wk (1)
- Localized tenderness in deep vein system (1)
- Swelling of entire leg (1)
- Calf swelling >3 cm than other leg (measured 10 cm below the tibial tuberosity) (1)
- Pitting edema greater in the symptomatic leg (1)
- Collateral venous collateral superficial veins (1)
- Active cancer or cancer treated within 6 mo (1)
- Alternative diagnosis more likely than DVT (e.g. Baker’s cyst, cellulitis, muscle damage, superficial venous thrombosis) (-2)

Total Score Interpretation
3-8: High probability, 1-2: Moderate probability, 0-2: Low probability

Low-Molecular-Weight Heparin vs. Coumarin for the Prevention of Recurrent Venous Thromboembolism in Patients with Cancer

Methods: RCT comparing the efficacy of LMWH (dalteparin) with an oral anti-coagulant agent (coumarin) in preventing recurrent thrombosis in patients with cancer.

Results: 27 of 338 patients in the dalteparin group had recurrent VTE versus 53 of 338 patients in the coumarin group (hazard ratio, 1.48; p = 0.002). The probability of recurrent thromboembolism at 6 mo was 9% and 17% in dalteparin and coumarin groups respectively. There was no significant difference in bleeding rates. The mortality rate was 39% in the dalteparin group and 41% in the coumarin group. 

Conclusions: In patients with cancer and acute VTE, dalteparin was more effective than coumarin in decreasing the risk of recurrent thromboembolism without increasing the risk of bleeding.
Approach to Treatment of Venous Thromboembolism

Purpose
- prevent further clot extension (3 mo duration is optimal)
- prevent acute pulmonary embolism (occurs in up to 50% of untreated patients)
- reduce the risk of recurrent thrombosis (duration depends on presence of other risk factors)
- treatment of massive iliofemoral thrombosis with acute lower limb ischemia and/or venous gangrene (phlegmasia cerulea dolens)
- limit development of late complications (e.g. postphlebitic syndrome, chronic venous insufficiency, and chronic thromboembolic pulmonary HTN)

Initial Treatment
- low molecular weight heparin (LMWH)
  - administered SC, at least as effective as UFH with a lower bleeding risk
  - advantages: predictable dose response and fixed dosing schedule; lab monitoring not required; <1% HIT; safe and effective outpatient therapy
  - disadvantages: only partially reversible by protamine, long-term use associated with osteoporosis
  - Costly!
  - relapsed cleared – must adjust dose in patients with renal dysfunction
- unfractionated heparin (UFH)
  - in patient with average risk bleed; use hospital-based nomograms that use bleeding risk and patient weight to determine appropriate dose
  - advantages: rapidly reversible by protamine
  - disadvantages: must monitor aPTT or heparin levels with adjustment of dose to reach therapeutic level (~2x normal value); monitor platelet counts for development of HIT
- alternatives to LMWH and UFH
  - direct thrombin inhibitors (hirudin, lepirudin, argatroban), direct factor Xa inhibitors (apixaban, rivaroxaban)
  - thrombolytic drugs (e.g. streptokinase, tPA) reserved for acute limb/life-threatening thrombosis, and low bleeding risk

Long-Term Treatment
- anticoagulant therapy
  - warfarin
    - standard treatment; should be initiated with heparin overlap; dual therapy for at least 48 hours with INR > 2, due to initial prothrombotic state secondary to warfarin’s inhibition of natural anticoagulants protein C/S, half life of vitamin K factors and risk of warfarin-induced skin necrosis
    - INR: warfarin dosed to maintain INR at 2-3, monitor twice weekly for 1-2wk. Discontinue heparin after INR>2.0 for 2 consecutive days
    - direct oral anticoagulants (DOACs)
      - apixaban or rivaroxaban; with no laboratory monitoring required, patients with CrCl > 50 ml/ min
    - dabigatran (factor IIa inhibitor): LMWH or IV heparin for at least 5-10 days before initiating dabigatran, patients with CrCl >30 ml/min
    - important drug interactions to consider for DOACs (no relevant food interactions however)
  - cancer patients: LMWH more effective than warfarin at preventing recurrence of venous thrombosis in cancer patients
- duration of anticoagulant treatment
  - provoked VTE with transient risk factor: 3 mo
  - provoked VTE with ongoing risk factor: consider indefinite therapy with annual reassessment
  - first unprovoked VTE: at least 3mo, subsequent reassessment
  - unprovoked proximal DVT or PE: consider indefinite therapy with annual reassessment
  - second unprovoked VTE: consider indefinite therapy
  - cancer-associated DVT: at least 3 mo, longer if continued evidence of cancer
- IVC filters
  - temporary filter indicated only if acute DVT (<4 wk) with significant contraindications to anticoagulant therapy (i.e. active bleeding) or if require interruption of anticoagulation (i.e. for urgent surgery)
  - must be retrieved once safe to do so as filter is pro-thrombotic in the long-term (consider anticoagulation if not retrieved)
- special considerations
  - pregnancy: treat with LMWH during pregnancy, then LMWH or warfarin for 6 wk post-partum (minimum total anticoagulation time of 3-6 mo, but must include 6 wks post-partum, as this is a high risk period); avoid warfarin in pregnancy due to teratogenicity
  - surgery: avoid elective surgery in the first three months after a venous thromboembolic event
    - pre-operatively: IV heparin may be used up to 4-6 h pre-operatively
    - perioperatively: warfarin or DOACs discontinued for at least 3-5 d pre-operatively (consider mechanism of drug clearance)
    - surgery safe when INR <1.5 off of warfarin, normal PT/TT on dabigatran, drug-specific Xa level at zero for apixaban/ rivaroxaban/LMWH, normal PT on IV unfractionated heparin

Duration of Treatment with Vitamin K Antagonists in Symptomatic Venous Thromboembolism

Cochrane DB Syst Rev 2009:CD001367
Study: Meta-analysis of 8 RCTs (2,994 patients) comparing different durations of treatment with vitamin K antagonists in patients with symptomatic VTE.
Results: In patients treated with vitamin K antagonists for a prolonged period, the reduction in risk of recurrent VTE remained consistent regardless of the period of time since the index event (OR 0.18; 95% CI 0.13-0.26). In addition, there was no observed excess of VTE recurrences following cessation of prolonged treatment (i.e. rebound phenomenon) (OR 1.24; 95% CI 0.91-1.69). However, patients who received prolonged treatment had a persistent increase in their risk of major bleeding complications (OR 2.61; 95% CI 1.40-4.61).
Conclusion: Prolonged treatment with vitamin K antagonists leads to a consistent reduction in the risk of recurrent VTE for as long as therapy is continued. Therapy should be discontinued when the risk of harm from major bleeding (which remains constant over time) is of greater concern than the absolute risk of recurrent VTE (which decreases over time). No specific recommendation was made regarding optimal duration of treatment.

Common Medications that Interact with Warfarin
- Acetaminophen (interference with vitamin K metabolism)
- Alopurinol
- NSAIDs (GI injury)
- Fluoroquinolones
- Metronidazole
- Sulfamethoxazole
- Tamoxifen

Initiation of Warfarin Therapy Requires Bridging with Heparin Therapy for 4-5 Days
- 10 mg loading dose (for example) of warfarin causes a precipitous decline in protein C levels in first 36 h resulting in a transient hypercoagulable state
- Warfarin decreases Factor VII levels in first 48 h, INR is prolonged (most sensitive to Factor VII levels), however full antithrombotic effect is not achieved until Factor IX, X, and II are sufficiently reduced (occurs after ~4 d)

Low Risk Surgical Patients
- <40 yr, no risk factors for VTE, general anesthetic (GA) <30 min, minor elective, abdominal, or thoracic surgery

Moderate Risk Surgical Patients
- >40 yr, >1 risk factor for VTE, GA >30 min

High Risk Surgical Patients
- >40 yr, surgery for malignancy or lower extremity orthopedic surgery lasting >30 min, inhibitor deficiency, or other risk factor

High Risk Medical Patients
- Heart failure, severe respiratory disease, ischemic stroke and lower limb paralysis, confined to bed and tube
Post-operatively: IV heparin, LMWH, DOAC can be used for anticoagulation (consult with surgeon prior to re-initiation).

For patients at high risk for thromboembolism (VTE <12 wk, recurrent VTE, antiphospholipid antibody syndrome, atrial fibrillation with prior stroke, mechanical heart valve), IV heparin or LMWH (bridging) should be given before and after the procedure while the INR is below 2.0.

**Prophylaxis**
- See sidebar.
- Consider for those with a moderate to high risk of thrombosis without contraindications.
- Non-pharmacological measures include: early ambulation, elastic compression stockings (TEDs), intermittent pneumatic compression (IPC).
- UFH 5,000 IU SC bid, UFH 5,000 IU SC tid or LMWH as per hospital protocol (e.g. enoxaparin 40 mg SC daily, dalteparin 5000 U SC qid), DOACs for orthopedic surgery thromboprophylaxis.

**Contraindications and Adverse Reactions of Anticoagulant Therapy**
- Absolute: active bleeding, severe bleeding diathesis, or platelets <20 x 10^9/L (<20,000/mm³).
- Intracranial bleeding.
- Neurosurgery or ocular surgery within <10 d.
- Relative: mild-moderate neurologic diathesis or thrombocytopenia, brain metastases, recent major trauma, major abdominal surgery within past 2 d, GI/GU bleed within 14 d, endocarditis, severe HTN (sBP >200 or dBP >120), recent stroke.

**Figure 14. Overview of hematologic malignancies and related disorders**

---

**Myeloid Malignancies**

### Acute Myeloid Leukemia

**Definition**
- Rapidly progressive malignancy characterized by failure of myeloid cells to differentiate beyond blast stage.

**Epidemiology**
- Incidence increases with age; median age of onset is 65 yr old; 80% of acute adult leukemias.
- Accounts for 10-15% of childhood leukemias.

---

**2009 WHO Classification of AML and Related Neoplasms**
- AML with recurrent genetic abnormalities.
- AML with myelodysplasia-related changes.
- Therapy-related myeloid neoplasms.
- Myelodysplasia.
- Myeloid proliferations related to Down syndrome.
- Blastic plasmacytoid dendritic cell neoplasm.
- AML, not otherwise specified (equivalent FAB classification).
- Undifferentiated (M1).
- Myeloblastic (M2).
- Promyelocytic (M3).
- Myelomonocytic (M4).
- Monocytic (M5).
- Erythroleukemic (M6).
- Megakaryocytic (M7).
- Acute basophilic leukemia.
- Acute panmyelosis with myelofibrosis.

---

**Acute Leukemia**

**Definition (WHO):** presence of 20% blast cells or greater in bone marrow at presentation.

**Classification:** divided into myeloid (AML) and lymphoid (ALL) depending on whether blasts are myeloblasts or lymphoblasts, respectively.

---

**Typical Age of Presentation of Leukemias**
- ALL: Children and older adults
- CML: 40-60 yr
- AML, CLL: >60 yr

---

**Leukemia:** malignant cells arise in bone marrow and may spread elsewhere (including blood, lymph nodes, and lymphoid tissue).

**Lymphoma:** malignant cells arise in lymph nodes and lymphoid tissues and may spread elsewhere (including blood and bone marrow).

**But** the location where the malignant cells are found does not solely define the type of hematologic malignancy – classified based on the characteristics of the cell (histology, histochemistry, immunophenotyping, cytogenetics, molecular changes).

---

**Myeloid proliferations related to Down syndrome:**
- Blastic plasmacytoid dendritic cell neoplasm.
- AML, not otherwise specified (equivalent FAB classification).
- Undifferentiated (M1).
- Myeloblastic (M2).
- Promyelocytic (M3).
- Myelomonocytic (M4).
- Monocytic (M5).
- Erythroleukemic (M6).
- Megakaryocytic (M7).
- Acute basophilic leukemia.
- Acute panmyelosis with myelofibrosis.

---

**Auer rods are pathognomonic for AML.**
Risk Factors
- myelodysplastic syndromes (MDS), benzene, radiation, Down Syndrome, alkylating agents as treatment for previous malignancy

Pathophysiology
- etiology subdivided into
  - primary: de novo
  - secondary: hematologic malignancies (e.g. myeloproliferative disorders and MDS) or previous chemotherapeutic agents (e.g. alkylating agents)
- uncontrolled growth of blasts in marrow leads to
  - suppression of normal hematopoietic cells
  - appearance of blasts in peripheral blood – risk of leukostasis
  - accumulation of blasts in other sites (e.g. skin, gums)
  - metabolic consequences; tumour lysis syndrome

Clinical Features
- anemia, thrombocytopenia (associated with DIC in promyelocytic leukemia), neutropenia (even with normal WBC), leads to infections, fever
- accumulation of blast cells in marrow
  - skeletal pain, bony tenderness (especially sternum)
  - organ infiltration
  - gingival hypertrophy (particularly myelomonocytic leukemia) – may present to dentist first
  - hepatosplenomegaly (in ALL)
  - lymphadenopathy (not marked in ALL)
  - gonads (in ALL)
  - skin: leukemia cutis or myeloid sarcoma
  - eyes: hemorrhages and/or whitish plaques, Roth spots, cotton wool spots, vision changes (uncommon)
- leukostasis/hyperleukocytosis syndrome (medical emergency)
  - large numbers of blasts interfere with circulation and lead to hypoxia and hemorrhage – can cause diffuse pulmonary infiltrates, CNS bleeding, respiratory distress, altered mental status, priapism
  - associated with AML more than ALL
- metabolic effects; aggravated by treatment (rare)
  - increased uric acid → nephropathy, gout
  - release of phosphate → decreased Ca++, decreased Mg++
  - release of procoagulants → DIC (higher risk in acute promyelocytic leukemia)
- decreased or normal K+ before treatment, increased K+ after treatment (from lysed cells)

Investigations
- blood work
  - CBC: anemia, thrombocytopenia, variable WBC
  - INR, aPTT, fibrin degradation products (FDP), fibrinogen (in case of DIC)
  - increased LDH, increased uric acid, increased PO4- (released by leukemic blasts), decreased Ca++, decreased K+
  - baseline renal and liver function tests
- peripheral blood film – circulating blasts with Auer rods (azurophilic granules) are pathognomonic for AML
- bone marrow aspirate for definitive diagnosis
  - blast count: AML >20% (normal is <5%)
  - morphologic, cytochemical, and/or immunotypic features are used to establish lineage and maturation (see sidebar for WHO classification of AML, H37)
- CXR to rule out pneumonia, ECG, MUGA scan prior to chemotherapy (cardiotoxic)

Treatment
- mainstay of treatment is chemotherapy (rapidly fatal without treatment)
- all AML subtypes are treated similarly, except acute promyelocytic leukemia (APL) with t(15:17) translocation
- all-trans-retinoic acid (ATRA) added to induce differentiation; arsenic trioxide + ATRA combination therapy for APL is non-inferior to traditional chemotherapy
- treatment strategy
  1. Induction: chemotherapy to induce complete remission of AML (see sidebar)
     - several possible regimens (e.g. cytarabine with anthracycline [daunorubicin])
     - patients with poor response to initial induction therapy – worse prognosis
     - must ensure reversal of DIC, platelet transfusions if <10
  2. Consolidation: to prevent recurrence
     - intensive consolidation chemotherapy
     - stem cell transplantation – autologous or allogeneic (younger patients with better performance status)
- consider acceleration with hematopoietic growth factors (e.g. G-CSF) if severe infection develops

Cure: survival that parallels age-matched population
Complete Remission: tumour load below threshold of detectable disease (normal peripheral blood film, normal bone marrow with <5% blasts, normal clinical state)
• supportive care
  ■ screening for infection via regular C&S of urine, stool, sputum, oropharynx, catheter sites, perianal area
  ■ fever: C&S of all orifices, CXR, start antibiotics
  ■ platelet and RBC transfusions (irradiated to prevent transfusion-related GVHD) ± EPO
  ■ prevention and treatment of metabolic abnormalities
  ■ allopurinol, rasburicase for prevention of hyperuricemia

Prognosis
• achievement of first remission
  ■ 70-80% if ≤60 yr old, 50% if >60 yr old
  ■ median survival 12-24 mo
  ■ prognosis is most related to 1) cytogenetics; classified as favourable, intermediate, or adverse and 2) molecular studies (i.e. NPM1+/FLT3- mutations)
• prognosis depends on cytogenetics, age, performance status, prior cytotoxic agents or radiation therapy

Myelodysplastic Syndromes

Definition
• heterogeneous group of malignant stem cell disorders characterized by dysplastic and ineffective blood cell production resulting in peripheral cytopenias, and a variable risk of transformation to acute leukemias
• syndromes defined according to World Health Organization (WHO) classifications (see sidebar)

Pathophysiology
• disordered maturation: ineffective hematopoiesis despite presence of adequate numbers of progenitor cells in bone marrow (usually hypercellular); formed elements sometimes exhibit qualitative functional defects
• intramedullary apoptosis: programmed cell death within bone marrow
• both processes lead to reduced mature cells in periphery
• <30% develop AML

Risk Factors
• elderly, post-chemotherapy, exposures (benzene, tobacco, radiation), inherited genetic abnormalities
• occurs in 4/100,000 patients >60 yr old

Clinical Features
• insidious onset; associated with pancytopenia; most patients asymptomatic at diagnosis
• infections and bleeding out of proportion with peripheral blood counts

Investigations
• diagnosed by
  ■ anemia ± thrombocytopenia ± neutropenia
  ■ CBC and peripheral blood film
  ■ RBC: usually macrocytic with oval shaped red cells (macro-ovalocytes), decreased reticulocyte count
  ■ WBC: decreased granulocytes and abnormal morphology (e.g. bi-lobed or unsegmented nuclei = Pelger abnormality)
  ■ platelets: thrombocytopenia, abnormalities of size and cytoplasm (e.g. giant hypogranular platelets)
• bone marrow aspirate and biopsy with cytogenetic analysis required for definitive diagnosis
• bone marrow: dysplastic and often normocellular/hypercellular
cytogenetics: high risk include partial or total loss of chromosomes 5, 7, and complex (>3 abnormalities)

Treatment
• low risk of transformation to acute leukemia (IPSS-R Very Low or Low)
  ■ erythropoietin stimulating agents weekly is first line in reducing transfusion requirements (EPO level must be <500)
  ■ if 5q deletion based on cytogenetics: lenalidomide PO
  ■ supportive care: RBC and platelet transfusion (consider iron chelation if frequent RBC transfusions)
• high risk of transformation to acute leukemia (IPSS-R Intermediate, High or Very High)
  ■ supportive care
  ■ stem cell transplantation if age <65 yr
  ■ epigenetic therapy: DNA methyltransferase inhibitors (e.g. 5-azacytidine), histone deacetylase inhibitors

Prognosis
• Revised International Prognostic Scoring System (IPSS-R) uses 5 factors to estimate mean survival:
  ■ cytology: % bone marrow blasts, hemoglobin, platelets, absolute neutrophil count
  ■ based on the calculated score, a patient’s MDS prognostic risk is “Very Low”, “Low”, “Intermediate”, “High”, or “Very High” with a mean survival of 8.7, 5.3, 3.0, 1.6, and 0.8 yr, respectively
**Myeloproliferative Neoplasms**

**Definition**
- clonal myeloid stem cell abnormalities leading to overproduction of one or more cell lines (leading to abnormalities in erythrocytes, platelets, and other cells of myeloid lineage)

**Epidemiology**
- mainly middle-aged and older patients (peak 60-80 yr)

**Prognosis**
- may develop marrow fibrosis with time
- all disorders may progress to AML

**Chronic Myeloid Leukemia**

**Definition**
- myeloproliferative disorder characterized by increased proliferation of the granulocytic cell line without the loss of their capacity to differentiate

**Epidemiology**
- occurs in any age group (mostly middle age to elderly) with a median age of 65 yr

**Pathophysiology**
- Philadelphia chromosome (Ph)
  - translocation between chromosomes 9 and 22
  - the c-abl proto-oncogene is translocated from chromosome 9 to “breakpoint cluster region” (bcr) of chromosome 22 to produce bcr-abl fusion gene, an active tyrosine kinase

**Clinical Features**
- 3 clinical phases
  - **chronic phase**: 85% diagnosed here
    - few blasts (<10%) in peripheral film
    - ± slightly elevated eosinophils and basophils
    - no significant symptoms
  - **accelerated phase**: impaired neutrophil differentiation
    - circulating blasts (10-19%) with increasing peripheral basophils (pruritus)
    - CBC: thrombocytopenia <100 x 10^9/L
    - cytogenetic evidence of clonal evolution
    - worsening constitutional symptoms and splenomegaly (extramedullary hematopoiesis)
  - **blast crisis**: more aggressive course, blasts fail to differentiate
    - blasts (>20%) in peripheral blood or bone marrow; reflective of acute leukemia (1/3 ALL, 2/3 AML)
- clinical presentation
  - 20-50% of patients are asymptomatic when diagnosed (incidental lab finding)
  - nonspecific symptoms
    - fatigue, weight loss, malaise, excessive sweating, fever
  - secondary to splenic involvement
    - early satiety, LUQ pain/fullness, shoulder tip pain (referred)
    - splenomegaly (most common physical finding)
  - anemia
  - bleeding: secondary to platelet dysfunction
    - pruritus, PUD: secondary to increased blood histamine
    - leukostasis, priapism, encephalopathy (rare): secondary to very elevated WBC (rare)

**Investigations**
- elevated WBC, decreased/normal RBC, increased/decreased platelets, increased basophils
- WBC differential shows a bimodal distribution, with predominance of myelocytes and neutrophils
• peripheral blood film
  ■ leukoerythroblastic picture (immature red cells and granulocytes present, e.g. myelocytes and normoblasts)
  ■ presence of different mid-stage progenitor cells differentiates it from AML
• bone marrow
  ■ myeloid hyperplasia with left shift, increased megakaryocytes, mild fibrosis
  ■ molecular and cytogenetic studies of bone marrow or peripheral blood for Philadelphia chromosome
• abdominal imaging for spleen size

**Treatment**

- **symptomatic**
  - allopurinol and antihistamines
- **chronic phase**
  - imatinib mesylate inhibits proliferation and induces apoptosis by inhibiting tyrosine kinase activity in cells positive for bcr-abl
  - if loss of response or intolerance (~40%), trial of 2nd generation TKIs: dasatinib or nilotinib
  - dasatinib and nilotinib may also be considered for first line management
  - interferon-a: may improve response to tyrosine kinase inhibitors; typically now only used for pregnant patients
  - hydroxyurea in palliative setting to reduce WBC
- **accelerated phase or blast phase**
  - refer for clinical trial or 2nd/3rd generation TKI and prepare for allogeneic stem cell transplant patients, in blast phase typically get standard AML induction
  - stem cell transplantation may be curative: to be considered in young patients who do not meet therapeutic milestones
  - treatment success is monitored based on therapeutic milestones
    - hematologic: improved WBC and platelet counts, reduced basophils
    - cytogenetic: undetectable Philadelphia-chromosome in the bone marrow
    - molecular: reduction/absence of bcr-abl transcripts in periphery and marrow

**Prognosis**

- survival dependent on response
  - those achieving complete cytogenetic response (CCR) on imatinib by 18 mo of therapy: 6 yr overall survival >90%
  - those who do NOT achieve CCR on imatinib: 6 yr overall survival of 66%
- acute phase (blast crisis – usually within 3-5 yr)
  - 2/3 develop a picture similar to AML
  - unresponsive to remission induction
  - 1/3 develop a picture similar to ALL
  - remission induction (return to chronic phase) achievable

---

**Polycythemia Vera**

**Definition**

- stem cell disorder characterized by elevated RBC mass (erythrocytosis) ± increased white cell and platelet production
- diagnosis (WHO 2008) requires either both major criteria plus one minor criteria OR the first major criterion plus 2 minor criteria
  - **Major Criteria**
    1. hemoglobin >185 g/L in men, >165 g/L in women or other evidence of increased red cell volume
    2. presence of JAK2 V617F or other functionally similar mutation such as JAK2 exon 12 mutation
  - **Minor Criteria**
    1. bone marrow biopsy showing hypercellularity for age with trilineage growth (panmyelosis) with prominent erythroid, granulocytic, and megakaryocytic proliferation
    2. serum erythropoietin level below the reference range for normal
    3. endogenous erythroid colony formation in vitro

**Clinical Features**

- symptoms are secondary to high red cell mass and hyperviscosity (see *Erythrocytosis, H6*)
- thrombotic complications: DVT, PE, Budd-Chiari (hepatic vein thrombosis), portal vein thrombosis, thrombopilebitis, increased incidence of stroke, MI
  - due to increased blood viscosity, increased platelet number and/or activity
  - bleeding complications: epistaxis, gingival bleeding, ecchymoses, and GI bleeding
  - if high platelet counts with associated acquired vWD
- erythromelalgia (burning pain in hands and feet and erythema of the skin)
  - associated with platelets >400 x 10^9/L
  - pathognomonic microvascular thrombotic complication in PV and ET
- pruritus, especially after warm bath or shower (40%)
  - due to cutaneous mast cell degranulation and histamine release
- epigastric distress, PUD
  - due to increased histamine from tissue basophils, alterations in gastric mucosal blood flow due to increased blood viscosity

---

**Erythromelalgia** is a pathognomonic microvascular thrombotic complication in PV and ET

**Cardiovascular Events and Intensity of Treatment in Polycythemia Vera**

*NEJM* 2013;369:22-33

**Study:** Prospective, RCT, mean follow-up of 28.9 mo. Blinding not described.

**Population:** 365 patients with JAK2-positive polycythemia vera being treated with phlebotomy, hydroxyurea, or both.

**Intervention:** Patients were randomized to a target hematocrit: <45% (low-hematocrit group) or 45-50% (high-hematocrit group).

**Outcome:** Composite of time until death from cardiovascular causes of major thrombotic events.

**Results:** The hazard ratio (HR) for the primary outcome was 3.91 (95% CI 1.45-10.53, p=0.007), while the HR for the primary outcome plus superificial venous thrombosis was 2.69 (95% CI 1.19-6.12, p=0.02) for the high-hematocrit group vs. low-hematocrit group.

**Conclusions:** The hematocrit target of <45% was associated with a lower incidence of cardiovascular events, major thrombotic events, and superficial venous thrombosis in patients with polycythemia vera.
Myeloproliferative Neoplasms

- gout (hyperuricemia)
  - due to increased cell turnover
- characteristic physical findings
  - plethora (ruddy complexion) of face (70%), palms
  - splenomegaly (70%), hepatomegaly (40%)

Investigations
- see Erythrocytosis, H6
- must rule out secondary polycythemia if high Epo level

Treatment
- phlebotomy to keep hematocrit <45%
- hydroxyurea (prior thrombosis or symptoms, severe coronary artery disease, refractory to phlebotomy)
- low-dose Aspirin® (for antithrombotic prophylaxis, will also treat erythromelalgia)
- allopurinol: as needed
- antihistamines: as needed

Prognosis
- 10-20 yr survival with treatment
- complicated by thrombosis, hemorrhage, leukemic transformation (AML)

Idiopathic Myelofibrosis

Definition
- excessive bone marrow fibrosis leading to marrow failure
- characterized by anemia, extramedullary hematopoiesis, leukoerythroblastosis, teardrop red cells in peripheral blood and hepatosplenomegaly

Epidemiology
- rare; median age at presentation is 65 yr

Pathophysiology
- abnormal myeloid precursor postulated to produce dysplastic megakaryocytes that secrete fibroblast growth factors
- stimulates fibroblasts and stroma to deposit collagen in marrow
- increasing fibrosis causes early release of hematopoietic precursors leading to:
  - leukoerythroblastic blood film (primitive RBCs and WBCs present in blood)
  - migration of precursors to other sites: extramedullary hematopoiesis (leading to hepatosplenomegaly)

Clinical Features
- anemia (severe fatigue is most common presenting complaint, pallor on exam in >60%)
- weight loss, fever, night sweats → secondary to hypermetabolic state
- splenomegaly (90%) → secondary to extramedullary hematopoiesis; may cause early satiety
- hepatomegaly (70%) → may get portal hypertension
- bone and joint pain → secondary to osteosclerosis, gout
- signs of extramedullary hematopoiesis (depends on organ involved)

Investigations
- CBC: anemia, variable platelets, variable WBC
- biochemistry: increased ALP (liver involvement, bone disease), increased LDH (2nd to ineffective hematopoiesis), increased uric acid (increased cell turnover), increased BUN (2nd to increased neutrophil mass)
- blood film: leukoerythroblastosis with teardrop RBCs, nucleated RBCs, variable polychromasia, large platelets, and megakaryocyte fragments
- JAK2 PCR and calreticulin PCR
- bone marrow aspirate: “dry tap” in as many as 50% of patients (no blood cells aspirated)
- bone marrow biopsy (essential for diagnosis): fibrosis, atypical megakaryocytic hyperplasia, thickening and distortion of the bony trabeculae (osteosclerosis)

Treatment
- allogeneic stem cell transplant is potentially curative
- JAK2 inhibitors (Ruxolitinib)
- symptomatic treatment
  - transfusion for anemia
  - erythropoetin: 30–50% of patients respond
  - androgens for anemia (e.g. danazol has shown transient response with response rates of <30%)
  - hydroxyurea for splenomegaly; thrombocytosis, leukocytosis, systemic symptoms
  - interferon-α (as second line therapy)
  - splenectomy (as third line therapy; associated with high mortality and morbidity)
  - radiation therapy for symptomatic extramedullary hematopoiesis, symptomatic splenomegaly

Efficacy and Safety of Low-dose Aspirin® in Polycythemia Vera
NEJM 2004;350:114-124
Study: Double-blind, placebo-controlled, RCT.
Participants: 518 patients with polycythemia vera (PV) with no clear indication for, or contraindication to, ASA therapy.
Intervention: Patients received either low-dose ASA 100 mg daily (n=253) or placebo (n=265) and were followed for up to 5 yr.
Primary Outcome: Cumulative rate of (I) nonfatal MI, nonfatal stroke, or death from cardiovascular causes and the cumulative rate of (II) the previous 3 plus PE and major venous thrombosis.
Results: Primary outcomes (I) and (II) were reduced with treatment compared to placebo (HR 0.41; p=0.09 and RR 0.4; p=0.63, respectively). There were no differences in overall or cardiovascular mortality and major bleeding episodes.
Conclusion: Low-dose ASA can safely prevent thrombotic complications in patients with PV.

Myelofibrosis can be either primary (idiopathic) or occur as a transformation of an antecedent PV or ET

A “leukoerythroblastic” blood film (RBC and granulocyte precursors) implies bone marrow infiltration with malignancy (e.g. leukemias, solid tumour metastases) or fibrosis (e.g. IMF)

IMF typically has a dry BM aspirate and teardrop RBCs (aspiration gives no blood cells)

A Double-Blind, Placebo-Controlled Trial of Ruxolitinib for Myelofibrosis
NEJM 2012;366:799-807
Study: Double-blind RCT of 309 patients with myelofibrosis randomized to ruxolitinib or placebo.
Outcome: Primary outcome was reduction in spleen volume of >35% at 24 wk. Secondary outcomes were durability of response, symptom burden, and overall survival.
Results: A greater proportion of patients on ruxolitinib had reduction in spleen volume >35% (41.9% vs. 2.7%) and this was sustained in 67% at 48 wk. Ruxolitinib also led to greater symptom improvement (40% vs. 5.3%) and less mortality (0% vs. 24%). There was no difference in rate of discontinuation due to adverse events (11.0% vs. 10.6%) but anemia and thrombocytopenia were more common with ruxolitinib.
Conclusion: Ruxolitinib reduced spleen size, improved symptoms and improved survival, compared with placebo.
Prognosis
- International Prognostic Scoring System (IPSS) for IMF uses 5 factors to determine mean survival
  - presence of constitutional symptoms; age >65; hemoglobin <100 g/L; leukocyte count >25,000/mm³;
  - circulating blast cells ≥1%
- based on the calculated score, a patient’s IMF is categorized as “low”, “intermediate 1”, “intermediate 2”, or “high” with a mean survival of 135, 95, 48, and 27 mo respectively
- risk of transformation to AML (8-10%)

Essential Thrombocythemia

Definition
- overproduction of platelets in the absence of recognizable stimulus
- must rule out secondary thrombocythemia

Epidemiology
- increases with age; F:M = 2:1, but F=M at older age

Diagnosis (2008 WHO Criteria) requires meeting all four criteria:
1. sustained platelet count >450 x 10⁹/L
2. bone marrow biopsy specimen showing proliferation mainly of the megakaryocytic lineage with increased number of enlarged, mature megakaryocytes; no significant increase or left shift of neutrophil granulopoiesis or erythropoiesis
3. not meeting WHO criteria for PV, primary myelofibrosis, bcr-abl CML, or myelodysplastic syndrome or other myeloid neoplasms
4. demonstration of JAK2 V617F or calreticulin (or in its absence another clonal marker), no evidence for reactive thrombocytosis

Clinical Features
- often asymptomatic
- vasomotor symptoms (40%)
  - headache (common), dizziness, syncope
  - erythromelalgia (burning pain of hands and feet, dusky colour, usually worse with heat, caused by platelet activation → microvascular thrombosis)
- thrombosis (arterial and venous)
- bleeding (often GI; associated with platelets >1,000 x 10⁹/L)
- constitutional symptoms, splenomegaly
- pregnancy complications; increased risk of spontaneous abortion
- risk of transformation to AML (0.6-5%), myelofibrosis

Investigations
- CBC: increased platelets; may have abnormal platelet aggregation studies or VWD studies
- JAK2 PCR assay; if negative, CALR PCR assay
- bone marrow hypercellularity, megakaryocytic hyperplasia, giant megakaryocytes
- increased K⁺, increased PO₂ (2° to release of platelet cytoplasmic contents)
- diagnosis: exclude other myeloproliferative disorders and reactive thrombocytosis

Treatment
- low dose ASA if previous history of thrombotic event, ≥1 cardiovascular risk factors, older, or symptomatic
- cytoreductive therapy if thrombosis or thrombotic symptoms: hydroxyurea (HU) (1st line therapy), anagrelide, interferon-α, or ³²P (age >80 or lifespan <10 yr)

Lymphoid Malignancies

Acute Lymphoblastic Leukemia

Definition
- malignant disease of the bone marrow in which early lymphoid precursors proliferate and replace the normal hematopoietic cells of the marrow
- WHO subdivides ALL into two types depending on cell of origin
  1. B-cell: precursor B lymphoblastic leukemia
  2. T-cell: precursor T lymphoblastic leukemia
- the French-American-British (FAB) classification (L1, L2, L3) is no longer encouraged, as morphology is not prognostic

75% of ALL occurs in children < 6 yr old; second peak at age 40
Clinical Features
- see Acute Myeloid Leukemia, H37 for full list of symptoms
- distinguish ALL from AML based on Table 32
- clinical symptoms usually secondary to:
  - **bone marrow failure**: anemia, neutropenia (50% present with fever; also infections of oropharynx, lungs, perianal region), thrombocytopenia
  - **organ infiltration**: tender bones, lymphadenopathy, hepatosplenomegaly, meningeval signs (headache, N/V, visual symptoms; especially in ALL relapse)

Investigations
- CBC: increased leukocytes >10 x 10^9/L (occurs in 50% of patients); neutropenia, anemia, or thrombocytopenia
- may have increased uric acid, K⁺, PO₄⁻, Ca²⁺, LDH
- PT, aPTT, fibrinogen, D-dimers for DIC
- leukemic lymphoblasts lack specific morphological (no granules) or cytochemical features, therefore diagnosis depends on immunophenotyping
- cytogenetics: Philadelphia (Ph) chromosome in ~25% of adult ALL cases
- CXR: patients with ALL may have a mediastinal mass
- LP prior to systemic chemotherapy to assess for CNS involvement (ensure adequate platelet count and PT/PTT)

Treatment
- eliminate abnormal cloned cells
  1. **induction chemotherapy**: to induce complete remission (undetectable leukemic blasts, restore normal hematopoiesis)
  2. **consolidation and/or intensification of chemotherapy**
     - consolidation: continuing same chemotherapy to eliminate subclinical leukemic cells
     - intensification: high doses of different (non-cross-reactive) chemotherapy drugs to eliminate cells with resistance to primary treatment
  3. **maintenance chemotherapy**: low dose intermittent chemotherapy over prolonged period (2-3 yr) to prevent relapse
  4. **prophylaxis**: CNS radiation therapy or methotrexate (intrathecal or systemic)

- hematopoietic stem cell transplantation: potentially curative (due to pre-implant myeloablative chemoradiation and post-implant graft-versus-leukemia effect) but relapse rates and non-relapse mortality high

Prognosis
- depends on response to initial induction or if remission is achieved following relapse
- good prognostic factors: young, WBC <30 x 10^9/L, T-cell phenotype, absence of Ph chromosome, early attainment of complete remission
- achievement of first remission: 60-90%
- childhood ALL: 75% long-term remission (>5 yr)
  - higher cure rates in children because of better chemotherapy tolerance, lower prevalence of bcr-abl fusion gene (associated with chemotherapeutic resistance)
- adult ALL: 30-40% 5-yr survival

**Hodgkin Lymphoma**

**Definition**
- malignant proliferation of lymphoid cells with Reed-Sternberg cells (thought to arise from germinal centre B-cells)

**Epidemiology**
- bimodal distribution with peaks at 20 yr and >50 yr
- association with Epstein-Barr virus in up to 50% of cases, causal role not determined

**Clinical Features**
- asymptomatic lymphadenopathy (70%)
  - non-tender, rubbery consistency
  - cervical supraclavicular (60-80%), axillary (10-20%), inguinal (6-12%)
  - splenomegaly (50%) ± hepatomegaly
  - mediastinal mass
    - found on routine CXR, may be symptomatic (cough)
    - rarely may present with SVC syndrome, pleural effusion
  - systemic symptoms
    - B symptoms (especially in widespread disease; fever in 30%), pruritus
    - non-specific/paraneoplastic
      - alcohol-induced pain in nodes, nephrotic syndrome
    - starts at a single site in lymphatic system (node), spreads first to adjacent nodes
      - disease progresses in contiguity with lymphatic system

**Investigations**
- CBC
  - anemia (chronic disease, rarely hemolytic), eosinophilia, lymphopenia, platelets normal or increased early, decreased in advanced disease
- biochemistry
  - HIV serology
  - liver enzymes and/or LFTs (liver involvement)
  - renal function tests (prior to initiating chemotherapy)
  - ALP, Ca²⁺ (bone involvement)
  - ESR, LDH (monitor disease progression)
- imaging
  - CXR, CT chest (lymph nodes, mediastinal mass), CT abdomen/pelvis (liver or spleen involvement), PET scans have replaced gallium scans
- cardiac function assessment (MUGA scan or echocardiography): for patients at high risk of pre-treatment cardiac disease (age >60, history of HTN, CHF, PUD, CAD, MI, CVA, malnourished), treatment can be cardiotoxic
- PFTs: if history of lung disease (COPD, smoking, previous radiation to lung)
- excisional lymph node or core biopsy confirms diagnosis
- bone marrow biopsy to assess marrow infiltration (only necessary if B-symptoms, stage III or IV, bulky disease or cytopenia)

**Treatment**
- stage I-II: chemotherapy (ABVD) followed by involved field or involved site radiotherapy (XRT)
- stage III-IV: chemotherapy (ABVD) with XRT for bulky disease
- relapse, resistant to therapy: high dose chemotherapy, autologous stem cell transplant
  - PET scan results essential in clarifying disease response

**Complications of Treatment**
- cardiac disease: secondary to XRT, adriamycin is also cardiotoxic
- pulmonary disease: secondary to bleomycin (interstitial pneumonitis)
- infertility: recommend sperm banking
- secondary malignancy in irradiated field
  - <2% risk of MDS, AML (secondary to treatment, usually within 8 yr)
  - solid tumours of lung, breast; >8 yr after treatment
- non-Hodgkin lymphoma
- hypothyroidism: post XRT

**Prognosis**
- Hasenclever adverse prognostic factors:
  1. serum albumin <40 g/L
  2. hemoglobin <105 g/L
  3. male
  4. stage IV disease
  5. age >45 yr
  6. leukocytosis (WBC >1.5 x 10^9/L)
  7. lymphocytopenia (lymphocytes <0.06 x 10^9/L or <8% of WBC count or both)
- prognostic score
  - each additional adverse prognostic factor decreases freedom from progression at 5 yr (FFP)

**Non-Hodgkin Lymphoma**

**Definition**
- malignant proliferation of lymphoid cells of progenitor or mature B- or T-cells

**Classification**
- multiple classification systems exist at present and may be used at different centres
- can originate from both B- (85%) and T- or NK- (15%) cells
  - B-cell NHL: e.g. diffuse large B-cell lymphoma, follicular lymphoma, Burkitt’s lymphoma, mantle cell lymphoma
  - T-cell NHL: e.g. mycosis fungoides (skin), TCL-NOS, anaplastic large cell lymphoma
- WHO/REAL classification system: 3 categories of NHLs based on natural history
  - indolent (35-40% of NHL): e.g. follicular lymphoma, small lymphocytic lymphoma/CLL, mantle cell lymphoma
  - aggressive (~50% of NHL): e.g. diffuse large B-cell lymphoma
  - highly aggressive (~5% of NHL): e.g. Burkitt’s lymphoma

**Clinical Features**
- painless superficial lymphadenopathy, usually >1 lymph node region
- usually presents as widespread disease (exception is aggressive lymphoma)
- constitutional symptoms not as common as in Hodgkin lymphoma
- cytopenia: anemia ± neutropenia ± thrombocytopenia can occur when bone marrow is involved
- abdominal signs
  - hepatosplenomegaly
  - retroperitoneal and mesenteric involvement (second most common site of involvement)
  - oropharyngeal involvement in 5-10% with sore throat and obstructive apnea
- extranodal involvement: most commonly GI tract; also testes, bone, kidney
- CNS involvement in 1% (often with HIV)

**Investigations**
- CBC
  - normocytic normochromic anemia
  - autoimmune hemolytic anemia rare
  - advanced disease: thrombocytopenia, neutropenia, and leukoerythroblastic anemia
- peripheral blood film may show lymphoma cells
• flow cytometry of peripheral blood lymphocytosis is valuable for low-grade NHL
• biochemistry
  ■ increase in uric acid
  ■ abnormal LFTs in liver metastases
  ■ increased LDH (rapidly progressing disease, poor prognostic factor)
• staging: CT neck, chest, abdomen, pelvis and bone marrow biopsy
• PET is useful for monitoring response to treatment and evaluation of residual tumour following therapy in aggressive histological disease
• diagnosed by
  ■ lymph node biopsy: excisional biopsy preferred, FNA unreliable
  ■ bone marrow biopsy: not optimal for diagnosis as BM involved in only 30% of high grade lymphomas

Treatment
• localized disease (e.g. GI, brain, bone, head and neck)
  ■ radiotherapy to primary site and adjacent nodal areas
  ■ adjuvant chemotherapy
  ■ surgery: splenic marginal zone lymphoma
• indolent lymphoma: goal of treatment is symptom management
  ■ watchful waiting
  ■ radiation therapy for localized disease
  ■ bendamustine plus rituximab, an anti-CD20 antibody, is superior to CHOP + rituximab (CHOP-R) for advanced stage disease (StIL trial)
• aggressive lymphoma: goal of treatment is curative
  ■ combination chemotherapy: CHOP is mainstay, plus rituximab if B-cell lymphoma
  ■ radiation for localized/bulky disease
  ■ CNS prophylaxis with high-dose methotrexate if certain sites involved (testicular)
  ■ relapse, resistant to therapy: high dose chemotherapy, autologous SCT
• highly aggressive lymphoma
  ■ Burkitt lymphoma: short bursts of intensive chemotherapy “CODOX-M” chemotherapy regimen also often used ± IVAC with Rituximab
  ■ CNS prophylaxis and tumour lysis syndrome prophylaxis

Complications
• hypersplenism
• infection
• autoimmune hemolytic anemia and thrombocytopenia
• vascular obstruction (from enlarged nodes)
• bowel perforation
• tumour lysis syndrome (particularly in very aggressive lymphoma) see Tumour Lysis Syndrome, H52

Prognosis
• follicular lymphoma: Follicular Lymphoma International Prognostic Index is used (5 adverse prognostic factors): age >60; >4 nodal areas; elevated LDH; Lugano stage III-IV; hemoglobin <120 g/L
  ■ based on calculated risk, mean 5 yr survival ranges from 53-91%
  ■ rarely curative, typically relapsing and remitting course with risk of transformation to aggressive lymphoma such as diffuse large B-cell lymphoma
• diffuse large B-cell lymphoma: The International Prognostic Factor Index is used (5 adverse prognostic factors): age >60; Ann Arbor stage (III-IV); performance status (ECOG/Zubrand 2-4); elevated LDH; >1 extranodal site
  ■ based on calculated risk, mean 5 yr survival ranges from 26-73%
  ■ ~40% rate of cure

Chronic Lymphocytic Leukemia

Definition
- indolent disease characterized by clonal malignancy of mature B-cells

Epidemiology
- most common leukemia in Western world
- mainly older patients; median age 70 yr
- M>F

Pathophysiology
- accumulation of neoplastic lymphocytes in blood, bone marrow, lymph nodes, and spleen

Clinical Features
- 25% asymptomatic (incidental finding)
- 5-10% present with B-symptoms (≥1 of: unintentional weight loss ≥10% of body weight within previous 6 mo, temperature >38°C or night sweats for ≥2 wk without evidence of infection, extreme fatigue)
- lymphadenopathy (50-90%), splenomegaly (25-55%), hepatomegaly (15-25%)
- immune dysregulation: autoimmune hemolytic anemia (Coombs positive), ITP, hypogammaglobulinemia ± neutropenia
- bone marrow failure: late, secondary to marrow involvement by CLL cells

Investigations
- CBC: clonal population of B lymphocytes >5 x 10^9/L
- peripheral blood film
  - lymphocytes are small and mature
  - smudge cells
- flow cytometry (CD5, CD20dim, CD23)
- cytogenetics: FISH (dictates response therapy and prognosis)
- bone marrow aspirate
  - lymphocytes >30% of all nucleated cells
  - infiltration of marrow by lymphocytes in 4 patterns: nodular (10%), interstitial (30%), diffuse (35%, worse prognosis), or mixed (25%)

Natural History and Treatment
- natural history: indolent and incurable; most cases show slow progression
- small minority present with aggressive disease; usually associated with chromosomal abnormalities (e.g. p53 deletion)
- first line therapy is dictated by cytogenetic status and patient co-morbidities
  - observation if early, stable, asymptomatic
  - treatment options vary by region; ideal first line therapy should include a monoclonal CD20 agent (e.g. rituximab, obinutuzumab)
    - commonly fludarabine + cyclophosphamide + rituximab (FCR) in fit patients with normal CrCl;
    - bendamustine + rituximab (BR) in less fit
    - chlorambucil + anti-CD20 obinutuzumab in the elderly
- corticosteroids, IVIg: especially for autoimmune phenomenon
- molecular therapies
  - Idelalisib – PI3K inhibitor
  - Ibrutinib – BTK (Bruton’s tyrosine kinase) inhibitor
Malignant Clonal Proliferations of Mature B-Cells

Prognosis
- 9 yr median survival, but varies greatly
- prognosis predicted by Rai staging and cytogenetic status
- low risk: lymphocytosis in blood and bone marrow only
- intermediate risk: lymphocytosis with enlarged nodes in any site or splenomegaly, hepatomegaly
- high risk: lymphocytosis with disease-related anemia (<110 g/L) or thrombocytopenia (<100 x 10^9/L)

Complications
- bone marrow failure
- immune complications: AIHA, ITP; immune deficiency (hypogammaglobulinemia, impaired T-cell function)
- polyclonal or monoclonal gammapathy (often IgM)
- hyperuricemia with treatment
- 5% undergo Richter’s transformation: aggressive transformation to diffuse large B-cell lymphoma (see Table 35)

Multiple Myeloma

Definition
- neoplastic clonal proliferation of plasma cells producing a monoclonal immunoglobulin resulting in end organ dysfunction
- usually single clone of plasma cells, although biclonal myeloma also occurs; rarely non-secretory

Epidemiology
- incidence 3 per 100,000, most common plasma cell malignancy
- increased frequency with age; median age of diagnosis is 68 yr; M>F

Pathophysiology
- malignant plasma cells secrete monoclonal antibody
  - 95% produce M protein (monoclonal Ig = identical heavy chain + identical light chain, or light chains only)
  - IgG 50%, IgA 20%, IgD 2%, IgM 0.5%
  - 15-20% produce free light chains or light chains alone found in either:
    - serum as an increase in the quantity of either kappa or lambda light chain (with an abnormal kappa:lambda ratio)
    - urine has Bence-Jones protein
  - <5% are non-secretors

Clinical Features and Complications
- bone disease: pain (usually back), bony tenderness, pathologic fractures
- lytic lesions are classical (skull, spine, proximal long bones, ribs)
- increased bone resorption secondary to osteoclast activating factors such as PTHrP
- anemia: weakness, fatigue, pallor
- secondary to bone marrow suppression
- weight loss
- infections
  - usually S. pneumoniae and Gram-negatives
  - secondary to suppression of normal plasma cell function
- hypercalcaemia: N/V, confusion, constipation, polyuria, polydipsia
  - secondary to increased bone turnover
- renal disease/renal failure
  - most frequently causes cast nephropathy (see Nephrology, NP32)
- bleeding
  - secondary to thrombocytopenia, may see petechiae, purpura
  - can also be caused by acquired Von Willebrand disease
- extramedullary plasmacytoma
  - soft tissue mass composed of monoclonal plasma cells, purplish colour
- hyperviscosity: may manifest as headaches, stroke, angina, MI
  - secondary to increased viscosity caused by M protein
- amyloidosis
  - accumulation of insoluble fibrillar protein (Ig light chain) in tissues; can cause infiltration of any organ system: cardiac infiltration – diastolic dysfunction, cardiac arrhythmias, syncope, sudden death; GI involvement – malabsorption, beefy large or laterally scalloped tongue; neurologic involvement – orthostatic hypotension, carpal tunnel syndrome
  - may cause Factor X deficiency if fibrils bind Factor X → bleeding (raccoon eyes)
- neurologic disease: muscle weakness, pain, paresthesias
  - radiculopathy caused by vertebral fracture, extramedullary plasmacytoma
  - spinal cord compression (10-20% of patients) is a medical emergency
Investigations

- CBC
  - normocytic anemia, thrombocytopenia, leukopenia
  - rouleaux formation on peripheral film
- biochemistry
  - increased Ca\(^{2+}\), increased ESR, decreased anion gap, increased Cr, albumin, β2-microglobulin (as part of staging), proteinuria (24 h urine collection)
- monoclonal proteins
  - serum protein electrophoresis (SPEP): demonstrates monoclonal protein spike in serum in 80% (i.e. M protein)
  - urine protein electrophoresis (UPEP): demonstrates light chains in urine = Bence-Jones protein (15% secrete only light chains)
  - immunofixation: demonstrates M protein and identifies Ig type; also identifies light chains
  - serum free light chain quantification: kappa and lambda light chains, calculated ratio
- bone marrow aspirate and biopsy
  - often focal abnormality, greater than 10% plasma cells, abnormal morphology, clonal plasma cells; send for FISH or cytogenetics (prognostic implications)
- skeletal series (x-rays), MRI if symptoms of cord compression.
- presence of lytic lesions and areas at risk of pathologic fracture
- bone scans are not useful since they detect osteoblast activity
- β2-microglobulin, LDH, and CRP are poor prognosticators

Diagnosis

- International Myeloma Working Group Criteria
  1. serum or urinary monoclonal protein
  2. presence of clonal plasma cells in bone marrow (>60% without "CRAB") or a plasmacytoma
  3. presence of end-organ damage related to plasma cell dyscrasia, such as:
    - increased serum Ca\(^{2+}\)
    - lytic bone lesions
    - anemia
    - renal failure
- supportive management
  - melphalan, prednisone, cyclophosphamide and proteasome inhibitor (i.e. bortezomib)
- dexamethasone and bortezomib if ARF; bortezomib ± dexamethasone in light chain amyloidosis
- treatment goals
  - improvement in quality of life (improve anemia, reverse renal failure, bony pain)
  - prevention of progression and complications
  - increase overall survival
- autologous stem cell transplant if <65 yr old
  - usually preceded by 4-6 mo of cytoreductive therapy: steroid based with novel agents (i.e. immunomodulatory drugs or proteasome inhibitors)
  - melphalan, prednisone, cyclophosphamide and proteasome inhibitor (i.e. bortezomib)
  - dexamethasone and bortezomib if ARF; bortezomib ± dexamethasone in light chain amyloidosis

Prognosis

- ISS - International Staging System (β2-microglobulin and albumin) used to stage and estimate prognosis
- revised ISS for risk stratification: combination of original ISS, cytogenetic profile (i.e. p53 mutation associated with poor survival and resistance to chemotherapy) and LDH
- median survival based on stage, usually 3-7 yr

Monoclonal Gammopathy of Unknown Significance

Definition

- presence of M protein in serum in absence of any clinical or laboratory evidence of a plasma cell dyscrasia or lymphoproliferative disorders
- incidence: 0.15% in general population, 5% of people >70 yr of age
- asymptomatic
Diagnosis
- presence of a serum monoclonal protein (M protein) at a concentration <30 g/L
- <10% plasma cells in bone marrow
- absence of hypercalcemia, renal insufficiency, anemia, bone disease related to the plasma cell proliferative process (absence of “CRAB”)
- 0.3-1% of patients develop a hematologic malignancy each yr
  - patients with M protein peak ≥15 g/L or patients with IgA or IgM MGUS are at higher risk of malignant transformation
  - patients with abnormal serum free light chains ratio are at increased risk of malignant transformation
- monitor with annual history, physical, CBC, Cr, calcium, albumin, serum protein electrophoresis (considered pre-malignant)

Lymphoplasmacytic Lymphoma
(Waldenstrom’s Macroglobulinemia)

Definition
- proliferation of lymphoplasmacytoid cells
  - presence of monoclonal IgM paraprotein

Clinical Features
- chronic disorder of elderly patients; median age 64 yr
- symptoms: weakness, fatigue, bleeding (oronasal), weight loss, recurrent infections, dyspnea, CHF (triad of anemia, hyperviscosity, plasma volume expansion), neurological symptoms, peripheral neuropathy, cerebral dysfunction
- signs: pallor, splenomegaly, hepatomegaly, lymphadenopathy, retinal lesions
- key complication to avoid: hyperviscosity syndrome
  - because IgM (unlike IgG) confined largely to intravascular space

Investigations and Diagnosis
- bone marrow shows plasmacytoid lymphocytes
- bone lesions usually not present
- blood work rarely see hypercalcemia
- cold hemagglutinin disease possible: Raynaud’s phenomenon, hemolytic anemia precipitated by cold weather
- normocytic anemia, rouleaux, high ESR if hyperviscosity not present

Treatment
- Bendamustine – R/R-CVP chemotherapy, alkylating agents (chlorambucil), nucleoside analogues (fludarabine), rituximab, or combination therapy
- corticosteroids
- plasmapheresis for hyperviscosity: acute reduction in serum IgM

Complications of Hematologic Malignancies

Hyperviscosity Syndrome

Definition
- refers to clinical sequelae of increased blood viscosity (when relative serum viscosity >5-6 units), resulting from increased circulating serum lgs or from increased cellular blood components in hyperproliferative disorders (e.g. multiple myeloma, leukemia, PV)
- Waldenstrom’s macroglobulinemia accounts for 85% of cases

Clinical Features
- hypervolemia causing: CHF, headache, lethargy, dilutional anemia
- CNS symptoms due to decreased cerebral blood flow: headache, vertigo, ataxia, stroke
- retina shows venous engorgement and hemorrhages
- bleeding diathesis
  - due to impaired platelet function, absorption of soluble coagulation factors (e.g. nasal bleeding, oozing gums)
- ESR usually very low

Treatment
- plasmapheresis, chemotherapy
Tumour Lysis Syndrome

Definition
• group of metabolic complications that result from spontaneous or treatment-related breakdown of cancer cells
• more common in diseases with large tumour burden and high proliferative rate (high grade lymphoma, leukemia)

Clinical Features
• metabolic abnormalities
  - cells lyse, releasing K⁺, uric acid, PO₄³⁻ (increased levels)
  - PO₄³⁻ binds Ca²⁺ (decreased Ca²⁺)
• complications
  - lethal cardiac arrhythmia (increased K⁺)
  - acute kidney injury (formerly known as renal failure, see Nephrology, NP18)

Treatment
• prevention
  - aggressive IV hydration
  - alkalization not recommended due to risk of calcium phosphate or xanthine precipitation in renal tubules
  - allopurinol or rasburicase
  - correction of pre-existing metabolic abnormalities
• dialysis

Blood Products and Transfusions

Blood Products
• RBCs, platelets and coagulation factors (frozen plasma [FP], cryoprecipitate, factor concentrates) are available for transfusion
• donated blood (1 U = 450-500 mL) is fractionated into these various components
  - centrifugation separates whole blood into RBCs and platelet-rich plasma
  - platelet-rich plasma is further fractionated into platelets and plasma
• need to pool together multiple units to obtain therapeutic amounts
• FP (previously known as FFP) is plasma frozen within 24 h of collection
• cryoprecipitate is the high MW precipitate generated when FP is thawed at low temperatures

Specialized Products
• irradiated blood products
  - prevent proliferation of donor T-cells in potential or actual bone marrow transplant recipients
  - used for immunocompromised patients or for patients on purine analogue chemotherapy, first-degree relatives, HLA-matched products and intrauterine transfusions, Hodgkin lymphoma
• CMV-negative blood products
  - potential transplant recipients
  - neonates
  - AIDS patients
  - seronegative pregnant women

Red Blood Cells

Packed Red Blood Cells
• stored at 4°C
• transfuse within 42 d of collection, otherwise cell lysis may result in hyperkalemia
• infuse each unit over 2 h (max of 4 h)

Indications for Packed RBC Transfusion
• Hb <70 g/L; this may change as per patient’s tolerance or symptoms
  - maintain Hb between 70 and 100 g/L during active bleeds
  - consider maintaining a higher Hb for patients with:
    - CAD/unstable coronary syndromes
    - uncontrolled, unpredictable bleeding
    - impaired pulmonary function
    - increased O₂ consumption
Selection of Red Cells for Transfusion
- when anticipating an RBC transfusion, the following should be ordered:
  - group and screen: determines the blood group and Rh status of the recipient as well as the presence of autoantibodies vs. major/minor blood group antigens in the patient’s serum
  - cross-match: involves mixing the recipient’s blood with potential donor blood and looking for agglutination (takes 30-45 min)
- when blood is required, several options are available
  1st line: fully crossmatched blood, electronic crossmatch is becoming more widely used (not always available in emergency situations)
  2nd line: donor blood of the same group and Rh status as the recipient
  3rd line: O- blood for females of reproductive age; O+ blood for all others

Platelets

Table 37. Platelet Products

<table>
<thead>
<tr>
<th>Product</th>
<th>Indication</th>
</tr>

<tbody>
<tr>
<td>Random donor (pooled)</td>
<td>Thrombocytopenia with bleeding</td>
</tr>
<tr>
<td>Single donor platelets</td>
<td>Potential BMT recipients</td>
</tr>
<tr>
<td>HLA matched platelets</td>
<td>Refractory to pooled or single donor platelets, presence of HLA antibodies</td>
</tr>
</tbody>
</table>

- stored at 20-24°C
- random donor platelets are transfused from a pool of 4 units; this should increase the platelet count by ≥15 x 10^9/L
- single donor platelets (transfused as single units) should increase the platelet count by 40-60 x 10^9/L
- if an increase in the platelet count is not seen post-transfusion: autoantibodies (i.e. TTP), alloantibodies, consumption (bleeding, sepsis), or hypersplenism may be present

Table 38. Indications for Platelet Transfusion

Multicentre RCT.
Participants: 418 critically ill patients with euolemic after initial treatment and hemoglobin less than 9 g/dL, within 72 h of ICU admission.
Intervention: Patients receiving a transfusion followed either (1) a restrictive strategy (RS; n=418) in which red cells were transfused if hemoglobin was less than 7.0 g/dL, and then maintained at 7 to 9 g/dL or (2) a liberal strategy (LS, n=406) in which transfusions occurred when the hemoglobin was less than 10.0 g/dL, and then maintained at 10 to 12 g/dL.
Primary Outcome: Mortality at 30 d and severity of organ dysfunction.
Results: Mortality rates at 30 d were similar between groups. However, mortality rates were significantly lower with the RS among less acutely ill patients (8.7% and RS group and 16.1% in LS group; p=0.03) and among those <55 yr of age (5.7% RS and 12% LS, p=0.02), but did not differ in a subgroup with clinically significant cardiac disease.
Conclusion: A RS of red cell transfusion is at least as effective as, and possibly superior to, a LS transfusion in critically ill patients.

Liberal or Restrictive Transfusion in High-Risk Patients After Hip Surgery (FOCUS) NEJM 2011;365:2453-2462
Participants: 2,016 patients aged greater than 50 yr with a history of or risk factors for cardiovascular disease and hemoglobin (Hb) level below 10 g/dL after hip-fracture surgery.
Intervention: Patients were randomly assigned to a liberal transfusion strategy (a Hb threshold of 10 g/dL) or a restrictive transfusion strategy (anemia symptoms or at physician discretion for a Hb level less than 8 g/dL).
Primary Outcome: Mortality or inability to walk across a room without human assistance on a 60 day follow-up.
Results: Primary outcome rates were 35.2% in the liberal transfusion strategy group and 34.7% in the restrictive transfusion strategy group. Rates of complications were similar in the two groups.
Conclusion: A liberal transfusion strategy did not reduce mortality rates or the inability to walk independently on 60 d follow-up compared to a restrictive transfusion strategy in elderly patients with high cardiovascular risk factors after hip surgery.
# Acute Blood Transfusion Reactions

## IMMUNE

### Acute Hemolytic Transfusion Reactions
- ABO incompatibility resulting in intravascular hemolysis secondary to complement activation, occurs immediately after transfusion
- most commonly due to incorrect patient identification
- risk per unit of blood is <1 in 40,000
- presentation: fever, chills, hypotension, back or flank pain, dyspnea, hemoglobinuria
- acute renal failure (<24 h) and DIC
- treatment
  - stop transfusion
  - notify blood bank and check for clerical error
  - maintain BP with vigorous IV fluids ± inotropes
  - maintain urine output with diuretics, crystalloids, dopamine

### Febrile Nonhemolytic Transfusion Reactions
- due to alloantibodies to WBC, platelets or other donor plasma antigens, and release of cytokines from blood product cells
- occurs within 0-6 h of transfusion
- risk per unit of blood is 1 in 100 (minor), 1 in 10,000 to 40,000 (severe)
- presents with fever ± rigors, facial flushing, headache, myalgia, hypotension
- treatment
  - rule out hemolytic reaction or infection
  - if temperature <38°C, continue with transfusion but decrease rate and give antipyretics
  - if temperature >38°C, stop transfusion, give antipyretics and anti-histamine

### Allergic Nonhemolytic Transfusion Reactions
- alloantibodies (IgE) to proteins in donor plasma result in mast cell activation and release of histamine
- occurs mainly in those with history of multiple transfusions or multiparous women
- risk per unit of blood is 1 in 100
- presents mainly as urticaria and occasionally with fever
- can present as anaphylactoid reaction with bronchospasm, laryngeal edema, and hypotension, but this occurs mainly in IgA deficient patients that have anti-IgA antibodies
- treatment
  - mild: slow transfusion rate and give diphenhydramine
  - moderate to severe: stop transfusion, give IV diphenhydramine, steroids, epinephrine, IV fluids, and bronchodilators

### Transfusion-Related Acute Lung Injury
- new-onset acute lung injury that occurs during transfusion or within 6 h of transfusion completion
- insidious, acute onset of pulmonary insufficiency
- profound hypoxemia (PaO\textsubscript{2}/FiO\textsubscript{2} <300 mmHg)
- bilateral pulmonary edema on CXR
- pulmonary artery wedge pressure <18 mmHg
- no clinical evidence of left atrial hypertension
- pathogenesis uncertain; perhaps due to binding of donor antibodies to WBC of recipient and release of mediators that increase capillary permeability in the lungs
- typically occurs 2-4 h post transfusion and resolves in 24-72 h
- risk per unit of blood is 1 in 10,000
- is currently the leading cause of transfusion-related morbidity and mortality
- treatment: supportive therapy (oxygen)
- inform blood bank; patient and donor testing will be arranged

## NONIMMUNE

### Transfusion-Associated Circulatory Overload
- due to impaired cardiac function and/or excessive rapid transfusion
- presentation: dyspnea, orthopnea, hypotension, tachycardia, crackles at base of lung, and increased venous pressure
- incidence: 1 in 700 and is becoming more common
- treatment: transfuse at lower rate, give diuretics and oxygen

### Bacterial Infection
- Gram positive: *S. aureus*, *S. epidermidis*, *Bacillus cereus*
- Gram negative: *Klebsiella*, *Serratia*, *Pseudomonas*, *Yersinia*
- overall risk is 1 in 100,000 for RBC and 1 in 10,000 for platelets
- never store blood >4 h after bag has left blood bank
- treatment: stop transfusion, blood cultures, IV antibiotics, fluids
**Hyperkalemia**  
- due to K⁺ release from stored RBC  
- risk increases with storage time and if blood is irradiated and risk decreases if given fresh blood  
- occurs in 5% of massively transfused patients  
- treatment: see Nephrology, NP13

**Citrate Toxicity**  
- occurs with massive transfusion in patients with liver disease – patients are unable to clear citrate from blood  
- citrate binds to Ca²⁺ and causes signs and symptoms of hypocalcemia  
- treatment: IV calcium gluconate (10 mL for every 2 units of blood)

**Dilutional Coagulopathy**  
- occurs with massive transfusion (>10 units)  
- pRBC contains no clotting factors, fibrinogen, cryoprecipitate, or platelets  
- treatment: FP, cryoprecipitate, and platelets

### Delayed Blood Transfusion Reactions

#### IMMUNE

**Delayed Hemolytic**  
- due to alloantibodies to minor antigens such as Rh, Kell, Duffy, and Kidd  
- level of antibody at time of transfusion is too low to cause hemolysis; later the level of antibody increases due to secondary stimulus and causes extravascular hemolysis  
- occurs 5-7 d after transfusion  
- presentation: anemia and mild jaundice  
- treatment: no specific treatment required; important to note for future transfusion  
- N.B. serologic transfusion reactions are the development of alloantibodies in the absence of frank hemolysis

**Transfusion-Associated Graft Versus Host Disease**  
- transfused T-lymphocytes recognize and react against “host” (recipient)  
- occurs 4-30 d following transfusion  
- most patients already have severely impaired immune systems (e.g. Hodgkin lymphoma or leukemia)  
- presentation: fever, diarrhea, liver function abnormalities, and pancytopenia  
- can be prevented by giving irradiated blood products

#### NONIMMUNE

**Iron Overload**  
- due to repeated transfusions over long period of time (e.g. β-thalassemia major)  
- can cause secondary hemochromatosis  
- treatment: iron chelators or phlebotomy if no longer requiring blood transfusion and not anemic

**Viral Infection Risk**  
- HBV 1 in 1.1 to 1.7 million  
- HCV 1 in 5 to 7 million  
- HIV 1 in 8 to 12 million  
- Human T-lymphotropic virus (HTLV) 1 in 1 to 1.3 million  
- other infections include EBV, CMV, WNV (West Nile virus)
Common Medications

Antiplatelet Therapy

<td>Dabigatran</td>
<td>Direct thrombin inhibitor</td>
<td>150 mg PO bid</td>
<td>Peak: 1 h</td>
<td>Not reversible</td>
<td>None (prolonged aPTT can suggest residual drug on board)</td>
<td>GI upset, Dyspepsia</td>
<td>Only indicated for AFib in Canada, Contraindicated in renal failure, cancer patients, mechanical heart valves</td>
</tr>
</tbody>
</table>

### Adverse Reactions of Heparin
- Hemorrhage: depends on dose, age, and concomitant use of antiplatelet agents or thrombolytics
- Heparin-induced thrombocytopenia: associated with venous or arterial thrombosis (see Table 22, H29)
- Osteoporosis: with long-term use

### Low Molecular Weight Heparin ([enoxaparin](#), [dalteparin](#), [tinzaparin](#))
- Increased bioavailability compared to normal heparin
- Increased duration of action
- SC route of administration
- Do not need to monitor aPTT
- Adverse reactions less common than UFH
- Patients with renal failure (CrCl <30 mL/min) can accumulate LMWH, therefore must adjust dose
- Only partially reversible with protamine sulfate
- HIT is less common

Factor Xa Inhibitors Versus Vitamin K Antagonists for Preventing Cerebral or Systemic Embolism in Patients with Atrial Fibrillation

**Purpose:** To review the evidence comparing factor Xa inhibitors with vitamin K antagonists for prevention of embolic events in patients with atrial fibrillation.

**Study:** Systematic review search 1950-2013, inclusive. Results included 10 RCTs, 42,084 patients, follow up for 12 wk to 1.9 yr.

**Outcome:** Stroke (hemorrhagic or ischemic) and non-CNS embolic event

**Results:** Factor Xa inhibitor treatment resulted in significantly fewer embolic events than dose adjusted warfarin treatment (OR 0.81; CI 0.72 to 0.91). There was no significant difference in rate of major bleeds between factor Xa inhibitors and warfarin treatment. Furthermore, factor Xa inhibitors resulted in significantly fewer intracranial bleeds and lower all-cause mortality.

**Conclusions:** Use of factor Xa inhibitor for anti-coagulation in patients with atrial fibrillation offered better protection against embolic events than warfarin. Factor Xa inhibitors also had equal or lower rates of adverse events.

Oral Direct Thrombin Inhibitors or Oral Factor Xa Inhibitors for the Treatment of Deep Vein Thrombosis

**Cochrane OB Sys Rev 2015;6: CD010956**

**Purpose:** To assess whether DTIs or factor Xa inhibitors are effective treatment for DVT.

**Study:** Systematic review search 1950-2013, inclusive. Results included 11 RCTs, 27,945 patients, comparing DTIs or factor Xa inhibitors to standard treatment (heparin, warfarin, and similar)

**Outcome:** Recurrent DVT or PE

**Results:** Separate meta-analyses of DTIs and factor Xa inhibitors showed that each was comparable to standard treatment in terms of DVT recurrence rates. Rates of fatal or non-fatal PE, and all-cause mortality were also not significantly different. Additionally, factor Xa inhibitors had lower rates of bleeding complications than standard treatment (OR 0.57; CI 0.43 to 0.76).

**Conclusions:** New oral treatment options, including direct thrombin inhibitors and factor Xa inhibitors represent reasonable and safe alternatives for acute.
